"M'ne is Maryan Angelica, you
mean," said the girl with a smart lit-
tle toss of her head.

"Why—why, mine is Genevieve Pa-
tricia!" exclaimed Jennie, remember-
ing. "And Janie's is Janice Laurinda!"

They all ran over to the ticket stall.
"My stars!" cried Dandy when he
heard their names. "I thought I could
depend on you. Head's swimming."

He tied the green handkerchief
around his forehead and searched
through a packet of tickets, finding
three, which he handed to the girls.

"Got every fancy name in the world
here," he said sulkily. "Got to quit the
job. Head gets too dizzy."

The tickets read simply:

Admit Maryan Angelica
Admit Janice Laurinda
Admit Genevieve Patricia.

The girls hurried over to the velvet
curtains, which were drawn aside at
once.

Inside, in the center of a great pol-

Several pale pink Arbutus flowers
sank to the floor and leaned their
heads on their slim arms. Rosebud
Natalie spread out her shining velvet
and smiled sweetly at nothing.

Paintetta began to make strokes
with her brush. It was a very large
canvas and the twins couldn't help but
think that even the flowers would be
tired before the picture was finished,
to say nothing of Cammie, when Pain-
tetta turned to pull a new set of hairs
from Cammie's hide and said:

"Come here, Rosemary Ardis, and
you Jonquil Lorrayne. Make your-
selves some brushes from Cammie.
Here are the sticks. I didn't give you
painting lessons for nothing. Come
now—paint in this border or we'll
never finish."

Cammie, who had been lying down
with his eyes closed, looking extreme-
ly sulky, got to his feet with such a
jerk that Paintetta and the canvas
went over backward and Rosemary
and Jonquil flew back to their places.

"No!" he shouted, stamping his
feet. "No more brushes—no more
nothin'—I'm going home!"

He walked over to the twins and

knelt down so that they could climb up on his back. Paintetta folded her stool and all the flowers sank back with a sighing sound like the sweet breath of the meadows in summer.

"Goodbye children!" called Mary Quite Contrary. "It doesn't matter for there are portraits enough of us."

Yawning widely, Paintetta walked over and climbed up behind the twins. "One, two, three. I wish we could be home in the twins' new nurseries," she chanted softly.

The velvet curtains drew aside and the twins caught a glimpse of Dandy Lion fast asleep with his head bowed among the tickets.

It was so very dark outside that they didn't see another thing until they were home in bed with Cammie and Paintetta on the footboard beside them.

THE THANKSGIVING DINNER

Clear tomato soup. Cracker crisps
Roast turkey, potato stuffing, brown
gravy

Cranberry jelly
Boiled rice. Creamed onions
Cole slaw

Home made pickles. Olives
Pumpkin pie. Fig pudding
Coffee

Grapes, oranges, ripe persimmons,
walnuts

Clear Tomato Soup

Cook 1 quart tomatoes with 1 pint water, 1 sliced onion, bit of bay leaf, 4 cloves, 2 teaspoons sugar, 1 teaspoon salt, for 20 minutes. Strain and add $\frac{1}{4}$ teaspoon soda. Thicken with 2 tablespoons butter and 3 tablespoons flour rubbed together. This can be made the day before and reheated when time to serve.

Cracker Crisps

Split thick milk crackers, butter inside and toast just before serving.

Roast Turkey

Put dressed turkey into pan of water to which has been added 1 teaspoon soda to 2 quarts water. With small cloth wash carefully inside and out, rubbing skin well. Then rinse thoroughly, letting plenty of water run through carcass. Dry well. Lay turkey on back, season inside with salt and pepper and stuff breast till it is smooth and plump. Fold skin of neck down on back and pin with skewer. Stuff body, press legs close to body, hold firmly with one hand and with the other push thigh up into side. Fasten with skewer run through from one leg to other. Lay wings close to body and fasten with skewer. Insert skewer under tail. Wrap cord around tail, bringing one end up on right side, wrapping twice around leg skewer, then up around wing skewer, across under back, repeating process on left side, bringing down and fastening at tail. Season all well and rub over with melted butter.

This should all be done the day before Thanksgiving, and if turkey is large it is well to bake for an hour the night before, leaving in oven as it cools off. Then start baking again about 8 o'clock in morning, keeping slow oven and basting frequently. While baking it should be laid first on one side, then on other, and as soon as browned turned on breast and left there until a few minutes before taking from oven, when it should be turned on back, allowing breast to brown.

Potato Stuffing

Two cups hot mashed potato, $\frac{1}{4}$ cup salt pork cubes, 2 tablespoons onion, 1 teaspoon poultry seasoning, salt and pepper, 1 cup cooked sausages cut in pieces. Cook the onion and the pork until yellow; add remaining ingredients.

Cranberry Jelly

Cook 4 cups cranberries with 1 cup water until tender. Press through strainer. To juice and pulp add 2 cups sugar and cook until ready to jelly (this requires but a few minutes brisk boiling). Pour hot into molds and let set over night.

Boiled Rice

Place in a double boiler $2\frac{1}{2}$ cups of boiling water and then add 1 teaspoon salt. Now add $\frac{1}{2}$ cup well washed, unpolished rice. Cover and cook until rice is tender and the water absorbed. Remove the lid and then

cover the rice closely with a clean napkin and cook for five minutes. This will fluff each grain of rice. Add butter when serving.

Creamed Onions

Remove the outer skins from 6 good sized onions and boil until tender, about 1 hour. Cover with $1\frac{1}{2}$ cups medium white sauce made by melting 3 tablespoons butter, rubbing in 3 tablespoons flour, adding salt and pepper and $1\frac{1}{2}$ cups milk or mixed milk and water, cooking few minutes.

Perfect Pumpkin Pie

(This recipe was first published in the Cultivator in 1910 and has since been printed many times on request. We think it might almost be claimed now as the Cultivator pumpkin pie.)

One of the poorest of all dishes is a pumpkin pie which is not what it ought to be, and one of the best is a perfect pie. The trouble is that in making it the ingredients are not rich enough; thick cream and plenty of eggs are really essential to its composition. This recipe is very nice: Get a small pumpkin and cut it up without peeling it; put it into a covered colander and steam till soft, and then remove the peel; put it into a dish in the oven and leave the door open till it is dry, but be careful not to let it grow brown or bake. Press it through the colander and measure; to $2\frac{1}{2}$ cups of pulp add 2 cups of cream, or very rich milk, 1 teaspoon each of salt, butter, cinnamon and ginger, 1 tablespoon of molasses, sugar to taste, and, after cooling and beating well, 2 well beaten eggs, or the yolks of four. Make a rich pie crust, line an extra large and deep tin, and leave an edge on top; pour in the pumpkin, bake slowly 40 minutes, or a little more, till there is a good brown crust on top; serve very cold, and all around the edge put large spoonfuls of thick whipped cream—a modern idea, but a great improvement on the old fashioned plan.

Fig Pudding

Delicious fig puddings may be purchased canned, but here is a good recipe: To $2\frac{1}{2}$ cups flour, sifted with 1 teaspoon soda, 1 teaspoon each ginger, cinnamon and nutmeg, add 1 cup molasses, 1 cup sweet milk, 1 cup chopped suet, 1 cup chopped figs and 1 cup stoned raisins. Steam in molds the size of pound baking powder cans, 2 hours.

Foamy Sauce. Beat whites 2 eggs until foamy, add 1 cup sugar, beat well, then add 1 cup scalded milk and juice 1 lemon. Water may be used instead of milk. To make yellow use the whole egg.

Hard Sauce. Cream $\frac{1}{4}$ cup butter, 1 cup powdered sugar, $\frac{1}{2}$ teaspoon vanilla, add $\frac{1}{4}$ cup heavy cream beaten till stiff.

CARVING THE TURKEY

Carving the turkey is a bugbear in many families. Here are simple directions that are worth studying and will "make carving a real pleasure."

Place the turkey or chicken so that the breast will be at the left hand of the carver. Insert the carving fork at the peak of the breastbone, plunging it down so as to gain good command. First cut off the leg with the second joint; then the wings on the side farthest from you. Tip the turkey from you and take off the leg and wing from the side toward you. Next carve thin slices from each side of the breast. Then remove the wish-bone from the carcass. Cut through the ribs first on one side, then on the other. With a quick turn of the knife, divide the front or breast from the back of the carcass. Now remove the fork, which has not been withdrawn from first to last. Divide the second joint from the drumsticks and make two pieces of each. Then divide the back, lower and upper half, at the second rib joint. The turkey is now ready for serving. At each helping give a portion of the dark and white meat unless a preference is expressed.

THANKSGIVING THE YEAR ROUND

A woman who has an almost old fashioned faith in Providence keeps who she calls her "thank offering box." Into this goes, through the year, from one Thanksgiving to the middle of the following November, a sum of money for every special joy.

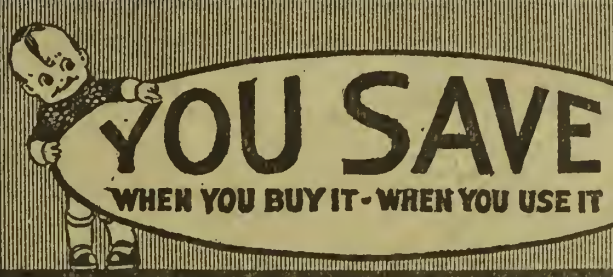

These offerings are not confined to

First: It is sold at a moderate price. You save when you buy it.

Second: It has more than the ordinary leavening strength, therefore, you use less.

Third: There are no failures—it always makes the sweetest, most palatable of foods.

Fourth: It is used by millions of housewives—leading domestic science teachers and cooking experts.

CALUMET BAKING POWDER

Fifth: It is the best Baking Powder that can be produced. Was given highest awards at World's Pure Food Exposition, Chicago; Paris Exposition, Paris, France.

Sixth: It contains only such ingredients as have been officially approved by the United States Food Authorities.

The finest quality Baking Powder—at the most economical cost. "The Biggest Bargain That Goes into the Kitchen Today."

Pound can of Calumet contains full 16 oz. Some baking powders come in 12 oz. instead of 16 oz. cans. Be sure you get a pound when you want it.

Calumet Nut Cookie Recipe

$\frac{1}{4}$ cup butter,
 $\frac{1}{2}$ cup sugar, 2
eggs, $\frac{1}{2}$ cup
flour, 1 level tea-
spoon Calumet
Baking Powder,
 $\frac{3}{4}$ cup chopped
nuts, 1 teaspoon
lemon juice.
Then mix in the
regular way.

RABBITS

Pedigreed Flemish Giants—Also Utility stock. No fancy prices. MAUD BEECHING, 1578 W. 46th Street, Los Angeles, California.

her own joys, but each time some member of her family bobs up from some threatened woe, into the box goes the money offering of thanks.

Not the same amount is given each time, and rarely large sums, for the woman is not rich, but a nice little sum is realized.

This is devoted to giving someone a happy Thanksgiving day. It does not always go into the regular channels. As the woman says, the poor and hospitals are usually well cared for in holiday seasons.

Sometimes a homestick girl in a strange city is given car fare home for the Thanksgiving gathering she would otherwise miss. Once a music lover was given a season ticket to the symphony concerts. Again a doctor's bill that had worried a young stenographer who had her mother to support was quietly paid.

In speaking of her pretty custom the owner of the thank offering box said: "Never have I known what thankfulness really meant until I started my box and saw the joy my thankfulness brings to others."

Such a box, besides cultivating one's bump of gratitude and making others equally grateful, cannot but afford great pleasure and interest in the spending. It is a gracious thought one more woman could profitably put into practice.

HINTS FROM HOUSEKEEPERS

Condensed Milk Mayonnaise

Thought perhaps the following recipe, which is a favorite of mine (not original with me), might be of interest to Cultivator readers, especially since eggs are bringing high prices: Beat ¾ cup condensed milk well, then add slowly, a little at a time, ¾ cup oil, beating all the time. Mix 1 teaspoon dry mustard, 1 teaspoon salt, 1/3 teaspoon paprika and a dash of pepper dissolved in 1½ teaspoons vinegar. And add this to above the last thing. The milk and oil will not thicken with beating as when egg is used but will do so when spices and vinegar are added. One advantage in making the above is that it never curdles.—Mrs. B. J. Wandrey, San Diego.

BEING THANKFUL

Being thankful is the gentle art of sowing well in thought as well as in the tilling of the soil. Kindness, laughter, freedom from unnecessary worry and all that goes to make the world a good place to live in forecast a harvest of goodness in the Thanksgiving time of life. We should be thankful for what we have as well as for what we hope to gain. Being thankful, however, should not be a matter of set time nor place. Make every day of the year one of thanksgiving and see how much better and bigger the day officially designated as such will seem. There is a big bond uniting all of us, for we are at best but workers in a common cause, pulling a common load and walking the same highway to the end of time.

GET READY FOR CHRISTMAS

The Cultivator offers this week opportunity to get patterns of some fascinating toys and dolly clothes. Every youngster gives its best love to the soft cuddlesome home-made rag doll or pussy cat. Don't you remember the grimy, disreputable old doll that always went to bed with you because it was so soft and comforting? These patterns give a chance to make for your own or somebody else's little one a toy or a set of doll clothes that will be loved and treasured.

NO AFFILIATION WHATEVER

"Don't you think that young man is afflicted with a swelled head?" "No," answered Miss Cayenne, "he's not afflicted with it; he enjoys it."—Edinburgh Scotsman.

HIDDEN BEAUTY

Sid Down—Why are silk shirts a luxury?

Stann Dup—Because you pay \$10 for them and your coat and vest cover all but a nickel's worth.—California Pelican.

A DELICIOUS ROAST

The main point is to have whatever is chosen cooked properly. The rump or a three-corner cut of beef can be roasted to give as great satisfaction as an expensive piece if prepared as follows:

Rub the entire flesh surface with half a cut lemon, letting it absorb as much of the juice as possible. Set away in cool place for several hours, repeating the process at intervals. When ready to roast, dredge with flour and bake without adding any water till over half done, when a little, in which salt and pepper have been dissolved, may be poured into the pan. It is not wise to select a roast of less than five pounds, but if a smaller cut is bought, remember that the fire must be just that much hotter when it is first put in. Reduce the oven heat after the meat is thoroughly browned on all sides and allow 15 minutes to the pound.

SWEET POTATO WAFFLES FOR THANKSGIVING BREAKFAST

One cup of mashed sweet potato, worked through a sieve; 2 tablespoons of flour, ¾ cup of milk, yolk of 1 egg (well beaten), ¼ teaspoon salt, 2 tablespoons sugar, 2 tablespoons fat, melted; well beaten white of egg. Cook in well greased hot waffle iron.

WHY HE WASN'T PROMOTED

He grumbled.
He was always behindhand.
He had no iron in his blood.
He was willing, but unfitted.
He didn't believe in himself.
His stock excuse was "I forgot."
He wasn't ready for the next step.
He did not put his heart into his work.
He learned nothing from his mistakes.
He ruined his ability by half doing things.
He chose his friends from among his inferiors.
He never dared to act on his own judgment.
He did not think it worth while to learn how.
Familiarity with slipshod methods paralyzed his ideal.
He tried to make "bluff" take the place of hard work.
He thought it was clever to use coarse and profane language.
He thought more of amusements than of getting on in the world.
He didn't learn that the best of his salary was not in his pay.
Still he wondered why he didn't get on.—Chesapeake & Ohio Employees Magazine.

To be thankful for what we have is well, but to be thankful for what we hope to gain is better. The quality of the seed forecasts the value of the harvest, all things equal. We sow well and we reap as we sow. We sow poorly and of an inferior quality and our returns become burdens for us to bear.

In the matter of prosperity it is safe to say that the majority who till the soil have fared well during the past year. This is not due to any luck or chance, but is a simple tribute to their energy and intelligent application of principles in which they have faith.

The man who has faith may move mountains. He who lacks faith in himself lacks faith in mankind, for most of us at our best are but reflections of what is good in others.

No work is done at its best until it is done in an atmosphere of thanksgiving. We can all of us surround our work with the cheery atmosphere which our Father has breathed into all His works.

NOT INFORMED

Jones—"Do you ever play golf, Miss Sportleigh?"
Miss Sportleigh—"Mercy, no, Mr. Jones. I don't know a thing about the game. I don't even know which end of the caddy you take hold of when you start to hit the ball."

Foreman—"Ere, do you know 'Opkins carries twice as much as you at a time?"
Workman—"Yus. I've told 'im abaht it, but 'e will do it.—Windsor.

The Cultivator Patterns

BE SURE TO SEND SIZE CHRISTMAS GIFTS

2967—A Set of Toy Animals. — Cut in one size. The cow requires ½ yard of 27-inch material and the horse, ¾ yard of 36-inch material. Price 10 cents.

3061—Doll's Set.—Cut in five sizes for dolls: 16, 18, 20, 22 and 24 inches in height. Size 18 will require ¾ yard of 36 inch material for the dress, ¾ yard of 40 inch material for the cape, and ½ yard of 20 inch material for the bonnet. Price 10 cents.

2970. A Set of Pleasing Toys for the Nursery. —Cut in one size. Either style requires ¾ yard of 27-inch material. Price 10 cents.

2275—A New Dress and Hat for Miss Dolly. — Cut in six sizes: For dolls 16, 18, 20, 22, 24 and 26 inches in length. Size 24 will require 1¼ yard of 27-inch material for the dress, and ¾ yard for the hat. Price 10 cents.

2937. Set of Toys.—Cut in one size. It will require ¾ yard of 24 inch material for either toy. Price 10 cents.

2273—A Dainty Set for Dolly.—The pattern includes all styles illustrated, is cut in six sizes for dolls: 16, 18, 20, 22, 24 and 26 inches in length. The dress requires 1¼ yard of 27-inch material, the petticoat ¾ yard, and the combination ¾ yard for an 18-inch doll. Price 10 cents.

2300—An Attractive Set of Toy Animals.—The patterns are cut in one size only. It will require ¾ yard of flannel for the sheep, ¾ yard for the dog and ¾ yard for the pig. Price 10 cents.

1902—Doll's Long Clothes Set. — Cut in three sizes: For dolls: 16, 18 and 20 inches in length. It will require 2¼ yards of 27 inch material for the dress, 1¾ yard of 24 inch material for the wrapper and 2¾ yards of 24 inch material for the coat, for an 18 inch doll. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns. Address

Our Thanksgiving Turkey

By Jean A. Koethen

THE turkey is America's most notable contribution to the world's store of breeds. When the first Spanish explorers landed on the Atlantic and Mexican coasts they found these large, handsome birds, not so large nor so handsome as the ordinary farm turkey of the present, but still striking enough to command immediate attention, roaming the hills and valleys and forests of the new world. Their food consisted of maize, berries, fruits, grains, acorns, and especially, where it was to be found, the pecan nut, of which they were extremely fond. When the food was exhausted in one locality they moved on to pastures new.

Such a great discovery could not fail of immediate publicity, even in that day. As early as 1541, nearly 80 years before the Pilgrims landed on Plymouth Rock, the turkey was known in England, we are told, and in 1570 it was introduced into France and eaten at the wedding feast of Charles IX and Elizabeth of Austria. A book written by a Spaniard named Oviedo about this time describes the bird as having been brought from New Spain (Mexico) to the Islands of Castilla del Oro and there bred in domesticated state. However the thing happened there seems to be no question that by the beginning of the seventeenth century the turkey was well known all over Europe, was in great demand for high festivals, and was already an inhabitant of many a farmstead.

Governor Bradford and the remnant of that courageous little band which braved the dangers of a stormy sea for the sake of their religious convictions found the same birds, doubtless well known to them, in New England, roosting in trees, living on nuts and bugs and grass seeds, far harder than the turkeys of our day. They were the chief dish at that first Thanksgiving celebration in the fall of 1621, when the Pilgrim Fathers and their families met to celebrate the ingathering of a bountiful harvest, and at that second celebration in May of 1922 when the few survivors of that awful winter met to express their gratitude for succor in the shape of the good ship Lion loaded with supplies, and from that day to this the turkey, our very best as well as our most typically American, has been the Thanksgiving bird.

The Mexican turkey differs somewhat from the wild turkey of the United States, being a little smaller and duller in color, and the wild turkeys of both the United States and Mexico differ from the Bronze, which is their descendant, in that the feathers of neck and body are of a more markedly coppery bronze than in the domesticated bird, changing in some lights to green or purple margined with an opaque line of velvet black.

Breeds

Seven breeds of turkeys are recognized by the Standard: Mammoth Bronze, White Holland, Bourbon Red, Narragansett, Slate, Buff and Black. Of these the Bronze and Narragansett are the largest, the Slate and Bourbon Red next, then the Buff, White Holland, and last of all the Black. A few California breeders have tried the experiment of breeding all and have succeeded sufficiently to make an interesting display at several shows, but the Bronze, White Holland and Bourbon Red are the only ones that appeal to the public, and the Bronze, or Mammoth Bronze, as it is more correctly known, is far in the lead in popularity. The White Holland and Bourbon Red, being considerably smaller than the Bronze, are especially suitable for a trade which demands medium sized birds, and should be largely bred on farms where fancy points are not desired, but for some reason the Bronze holds its own against all comers and is the favorite in farmyard as well as showroom.

Possibly one reason for the popularity of the Mammoth Bronze turkey is that, while it often reaches a very large size, mature males not infrequently reaching a weight of 40 pounds or more, without careful breeding it degenerates in size quickly, so that the

average size of the young male at Thanksgiving is only around 16 pounds, and many birds go to market that have not attained this weight even. Since size appears to be largely a matter of breeding, breeders no doubt argue, why try another breed when you can get any size you want in the Bronze?

Mating and Breeding

Lack of vigor in the young stock has been the one hindrance to the spread of turkey culture. In many sections of the Atlantic coast where turkeys were formerly bred by thousands hardly one is to be seen, and here in the West turkey culture is sporadic and uncertain. This year a farmer's wife has a fine flock. Next year you go back for your Thanksgiving dinner, and there isn't one on the place. Why? "Couldn't raise them. Lost too many poults."

We call it blackhead, and experts are constantly experimenting, hoping to find some method of feeding which will keep the blackhead microbe from developing, but there are those who say we must look farther back than that, that the disease blackhead is only a symptom and must be treated at its root. Edward Brown, the English authority, says: "I have no doubt whatever that the most potent reason for weakness in poults is due to the use of immature stock, a fact which is becoming recognized by breeders, though not nearly to the extent necessary. It is generally accepted that a turkey does not attain maturity till it is nearly three years old. That being the case, from that age onward should be the period when the birds will transmit to their progeny the greatest amount of constitutional vigor. On the other hand, if mated before maturity is attained, or rather before it is approaching, and such mating is continued in successive generations, gradually lessened powers are the result."

"A safe rule," Mr. Brown says, "will be not to use yearlings of either sex as breeders, but to regard that as the period of growth. Matings should be made when the birds are two years old and can be continued for three years. If either bird is younger it should be the male. An active two year old male can be used with a score of hens, reducing the number in succeeding years till ten is his final year's harem."

In selecting turkeys for breeding look for a large frame, a deep keel, long sternum and stout legs, abundantly covered with strong thick muscles. If only the skeleton is large, heavy weight is not desirable. Hens weighing 16 to 17 pounds and toms weighing 20 to 22 will produce quicker growing poults than fat specimens weighing several pounds more.

In mating it is extremely important that the tom be not related to the hens. Many experts believe that in breeding is one secret of the weakness of young stock. They argue that even if the breeder send a long distance for his tom he cannot be sure that he is not distantly related to the females, and that where breeding is carried on, as it is in some communities, year after year, the different breeders or farmers buying eggs or males from each other with the idea of improving their stock, it is only a question of time till all the stock in that neighborhood is related. Some of these experts see in the importation of wild stock the only relief for the situation, but unless some of this wild stock is kept free from intermixture ever this is only a temporary relief. Breeders who have tried the wild stock find that the poults are far less susceptible to disease than poults from domestic stock and that when domestic and wild stock are crossed the vigor of the poults is in proportion to the amount of wild blood in the mixture.

The attaining of vigor in poults of domesticated stock is a problem of which a good many experts are working, and so far without marked success. Adult birds are more vigorous and healthy than chickens, but the young must be fed and cared for with solicitude and exactitude, and even then, between the experts who advise opposite methods we are in great confusion of mind. One says: "It is

overfeeding that kills." Another, "Underfeeding is worse than overfeeding." Another, "Feed nothing but boiled egg," and still another, "No egg at all, but cottage cheese," while a third condemns both egg and cottage cheese and feeds Johnny cake. Doesn't it look as if Mr. Brown might be right, and errors in breeding are more fundamental than errors in feeding? Where is the Moses who will lead turkey culture out of the darkness and confusion in which it is bogged into the light of rigid adherence to scientific principles in both breeding and feeding?

Poultry Queries

Conducted by J. A. Koethen

Why Not More Eggs?

I have 60 White Leghorn hens which I feed Egyptian corn and wheat morning and evening, dried bread at noon, dry mash before them all the time, ten acres of alfalfa to run on, fresh water daily, roosts and house swept and sprayed daily, new straw in nests every morning, skim milk all the time, but production has fallen off from 55 eggs a day in May to 14 in October. It seems to me that with this care I should have more eggs. Is it because they are winter layers or because there is something wrong with my feeding?—Subscriber, Chowchilla.

Neither one. Your hens are very fortunate indeed to have such perfect care, and they are repaying your care handsomely. There are very few flocks that can show an average of nearly 25 per cent among mature hens, as I take yours to be, in October. You say "they are about through molting, but most of them have very thin feathers," and in that sentence you answer your own question. Very few hens can make eggs and feathers at the same time. They have to stop laying in order to put the protein in the feathers. I think your hens have laid rather too well and that is why their feathers are thin. Now they just have to let up on the laying and get ready for winter. If I were you I would give them a moist mash once a day to tone them up a little. Mix the dry mash with sour milk and feed about two o'clock, just what they will clean up in 15 or 20 minutes. You might also add a little oil cake meal to the dry mash, and a handful of sunflower seed as often as you can to the scratch feed. Sunflower seed is expensive, but even a little helps. This additional protein will hasten the growth of the feathers.

Winter Pasture

What may I plant that will make the best winter pasture for chickens?—Subscriber, Kingsburg.

Most poultrymen in this section plant barley in their chick runs in the fall, so that it is several inches high when the chicks begin to come on. If it is too high they will not get so much good of it, but even then they like to run in it and hunt for bugs. If you can plan your planting so that it will be so tall that they can not kill it off immediately and not too tall for them to eat, there is nothing better. Rape is also very good, grows quickly anywhere, but is not quite so succulent.

Pure Bred Leghorns

What constitutes a pure bred White Leghorn hen?—C. J., Petaluma.

A pure bred White Leghorn is one whose ancestry is free from any taint or mixture with other breeds for a good many generations back—I do not know how many, but so far that no foreign color shows in plumage or legs. The plumage should be absolutely pure white; shanks, beak and ear lobes yellow. If there is any color in the plumage or if the shanks are not yellow, as sometimes happens in birds with an admixture of Minorca blood, the bird cannot be called pure bred. White Leghorn chicks that are

pure sometimes show black spots in the first feathers but they whiten out in the adult fowls.

Ticks and Lice

Two years ago I moved from the city to a farm and of course knew nothing about poultry. I now have a flock of 300 chickens and 40 turkeys and so far have found a solution to every problem in your paper. My chickens have both ticks and lice. If zenoleum is good for ticks and sodium fluoride for lice, could I mix them together for a dip? I have 200 fine pullets that are developing dark reddish wart-like growths on their combs, beaks and earlobes. Do you know the cause and cure of this?—Subscriber, Tulare.

Not being a chemist, I cannot say what kind of a mixture zenoleum and sodium fluoride would make, but as this is not the season for dipping fowls it will be much safer and better to use them separately. The zenoleum should be used for painting walls, roosts and nests after you have cleaned them thoroughly with water. For ticks on the bodies of the birds, touching each tick with a feather or brush dipped in corrosive sublimate is considered the surest method of getting rid of them, but, as corrosive sublimate is a rather dangerous thing to handle, I would rather try greasing the birds well first with vaseline or lard. You will have to do this on a fairly warm day and keep them in a protected place till the grease has soaked in. The ticks that are not killed by the grease can be touched with corrosive sublimate. Those dark red warts on the combs of the pullets are chickenpox nodules. The only remedy that is advisable after the disease has developed is sulphur mixed in the mash. Get the dry powder, "flowers" or "flour" of sulphur, and mix in the dry mash, making it about five per cent of the mash. This is said to relieve the attack considerably.

CALIFORNIA EGG LAYING CONTEST

By Max Kortum

Santa Cruz, report for week ending November 7.

The hens are coming down the home stretch on the last lap. Bellows Brothers of Lakeside are sure winners with a lead of nearly 100 eggs. The moment of excitement is now centered on the pens of S. L. Gibson of Santa Cruz, D. B. Walls of Petaluma and the Enterprise Ranch of Chino, who are running neck to neck for second and third place. For second place the odds are in favor of S. L. Gibson, but it is about a stand-off between Walls and Enterprise who will come in third. Although Walls has a lead of two eggs, the Enterprise birds are laying heavier. D. B. Walls' "Pride of Petaluma," who has been the "leading lady" all through the year, laid her 291st egg on Friday, and according to her schedule she should lay five, if not six, eggs more before the contest closes. Up to date she has the wonderful record of having laid 5.7 eggs—almost six eggs—on the average for each of the 51 weeks that the contest has run.

The standing of high pens and hens up to the end of the 51st week is as follows:

High Hens: Walls, 291 eggs; Webb, Gibson, 2,021; Walls, 2,018; Enterprise, 2,014; Neef, 1,984; Gibson, 1,962; Rose, 1,927; Barker, 1,926; Wood, 1,894.

High Pens: Walls, 291 eggs; Webb, 257; Gibson, 254; Bellows, 251; Enterprise, 251; Peck, 251; Peck, 251; Neef, 250; Neef, 249; Pasquale, 249.

SONOMA COUNTY EGG LAYING CONTEST

The poultry department of the Sonoma County farm bureau started an egg laying contest at Petaluma on November 1. There are now 36 entries in the contest, which is the present capacity of the building.

At the end of the first week the standing of the five highest pens composed of ten hens each was as follows: S. G. King, Petaluma, 38 eggs; J. J. King, Petaluma, 37; V. H. Guthrie, Petaluma, 35; E. O. Hussey, Petaluma, 35; Ray Cole, Petaluma, 33; W. L. McAllister, Sonoma, 33.

There are three pens or entries of 12 hens each, two of which are alternates, placed together in each pen of the contest building.

"HANES"—the national nameplate on underwear is an unfailing guide!

UNDERWEAR

BUY "Hanes" winter underwear for men on the strict business basis of the most unusual quality, comfort and service ever sold at the price!

Every garment bearing the "Hanes" national nameplate returns in wear and in absolute satisfaction far more than you pay for it. Our guarantee is your safeguard. It proves our faith in "Hanes"!

"Hanes" underwear is made in heavy weight and medium weight Union Suits and heavy weight Shirts and Drawers. The new medium weight Union Suit carrying the yellow label, meets the demand of men who prefer a medium weight union suit. It is made of full combed yarn and silk trimmed.

Bran: Kansas, 44.50.

Wheat: Mixed, Utah-Idaho, 47.00.

Corn bulk, 2.28½.

HAY

Alfalfa Growers of California, report under date of November 17:

Market continues firm under good demand and moderate offerings. The general depression would affect us too in time, but even then there is no danger of the market for our product going to pieces, as we are in a relatively stronger position, that is, provided our association is strong enough to meet the situation. What we have to be prepared for in this connection is a rapidly increasing alfalfa acreage in the state. Alfalfa being about the only principal farm product which has kept its own in price, as a result of fairly intelligent distribution, has now become the center of attraction for the growers of cotton, beets, beans, barley, etc., many of whom are planning to go into alfalfa some on a large scale, up to 2,500 acres in some instances, according to the newspapers. Fortunately there is room for expansion of the alfalfa and dairy industries of the state, provided both industries keep step with each other, and provided that the distribution is well regulated. As we see it, with a strong association there is not much danger from that class of new growers who know what they are doing when they go into alfalfa and have the necessary means for going into it right; this class of men also knows that their success depends on a strong association and they will do their part to make it so. There is however another class of men who do not realize what they are doing when changing to alfalfa. They are usually hard up for money to start with, do not appreciate that it takes several times more money per acre than formerly to establish an alfalfa ranch, and that the returns during the first year, even at good prices, are quite small. The result will be that they are deeply in debt by the time their first returns come in, and if prices then are not exceptionally high, they are bound to go to the wall. I believe we can hardly be accused of being pessimists about the present or the future of the alfalfa market, but as far as we can see ahead at present, it certainly does not look to us as if we could expect exceptionally high prices for alfalfa during the next few years.

There were 1,000 tons received on the tracks in Los Angeles the week ending November 13, with 150 tons left over as against 750 tons the week before.

GREAT CONVENTION WEEK

(Continued from Page 675.)

During the war when the government took over a large percentage of some of our dried fruits and canned foods there was such an obvious shortage of stock that canners and dried fruit packers in their effort to keep their goods out of the hands of speculators allocated the stock remaining among their former customers, giving them the opportunity of taking the goods at the opening price if they wanted them. It was impossible to guess at the cost of the goods in advance because of the ever advancing wages and constantly rising cost of materials; so such orders were entered "firm at opening prices," that is, if the buyer decided to take the goods he had to agree to take them at the price to be fixed later. Under ordinary conditions this would be an arbitrary proceeding, but when there was a shortage and practically every

order was reduced below the normal quantity, and when everyone knew that the trade conditions were such that the buyer could sell at a profit, there was little hesitation or complaint.

Fortunately, the raisin growers, peach growers and the walnut and almond growers have anticipated these conditions and have done consistent advertising. The prune growers, too, have done something and should do more. Various canners have been helping in their national advertising, all of which is helpful to the fruit industry and to the state of which the fruit industry is its principal asset. There is need of cooperation along these lines and with consistent effort we shall remove the present problem of underconsumption, as well as the impending problem of overproduction, which will involve the welfare of the whole state unless the conditions are frankly discussed, thoroughly understood and wisely handled.

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Yield of Walnuts

What would be considered a fair average yield in pounds per acre of a 15 year old English walnut grove planted 50 feet apart each way? Also what would be the yield of a fully mature English walnut tree? Up to what age are English walnut trees supposed to bear profitable crops?—Subscriber, Riverside.

The California Walnut Growers Association reports: "There are commercial walnut groves in the state of California which produce over a ton of marketable walnuts to the acre annually. There are many that produce over 1,000 pounds. The actual 1918 yield of the 922 growers reporting figures gave 949 pounds per acre for trees over 12 years of age, and an average of 500 pounds per acre for trees from seven to 12 years old. A safe estimate for business purposes is 900 to 1,200 pounds per year, per acre, for mature trees." Ralph E. Smith says in "Walnut Culture in California" that he knows of many seedling walnuts in the northern part of the state that are close to 60 years of age, but in the southern part of the state many trees and groves planted less than 40 years ago have almost entirely died out, largely on account of an uncertain or irregular supply of soil moisture. J. B. Neff says that where these old trees have been given care they are still bearing profitable crops. In fact, in France there are heavily bearing walnut trees 300 years old. These are roadside trees that have plenty of room for root growth.

Apricots Not Bearing

Will you please tell me what to do with my six year old apricot trees? They bore fruit three years ago but since then have not had any fruit. I water them about once a month and they seem to grow very rank.—Subscriber, San Dimas.

The subscriber does not give the variety of apricots so we are unable to give very definite information. They may have been severely winter pruned and gone largely to wood production or they may be of a variety which is not a good bearer in that section. For instance, the Early Moorpark is one of our very finest apricots but in some sections is a very shy bearer. It might be best to determine what variety they are and if the variety is a good bearer then perhaps by allowing plenty of growth to remain on the tree to make fruit sprouts it may be induced to set a crop.

WEATHER REPORT

San Francisco, Cal., November 13, 1920.

80 Highly Bred Registered 80
HOLSTEINS

At Public Auction

State Fair Grounds, Sacramento, Cal.

Thursday, December 16, 1920

This offering will contain some of the most highly bred, high record females offered in California this year, and carrying the services of outstanding bulls of high record ancestry, including:

A 1000 POUND GRANDDAUGHTER OF KING OF THE PONTIACS

FOUR DAUGHTERS OF THE ABOVE COW, ONE WITH SPLENDID YEARLY RECORD

DAUGHTERS OF PRINCE GELSCHER WALKER KORN-DYKE, INCLUDING A 27 POUND 3 YEAR OLD

DAUGHTERS OF KING AAGGIE MEAD, FULL BROTHER TO AAGGIE ACME OF RIVERSIDE 2ND

Females bred to SIR AAGGIE DE KOL ACME, SIR AAGGIE MEAD, SIR PIETERTJE ORMSBY CANARY, KING SEGIS ALCARTRA PRILLY, and other sires of outstanding merit.

Contributors to Sale:

GRAIN AND COTTON SEED

BUNYIP, BAYAH and DART IMPERIAL SEED WHEATS

California acclimated Australlans; best milling; higher prices for product; yield well; shatter less in wind than other varieties known to us.

MARIOUT

There is large demand for this early maturing, drought resistant barley. Car load just shipped Miller & Lux averaged approximately 130 lbs. per sack. All our re-cleaned Mariout, when well-jigged, has approximately such weight.

All our seeds grown on new soils, one irrigation only. All water from deep wells. No Bermuda, Johnson or Morning Glory.

Last call for Beldi Barley, Sonora, Early Baart, and the so-called Diener Hybrid Wickets, but can yet supply less than car load lots. No Tennessee Winter or Four Thousand Barley.

DURANGO and MEBANE COTTON SEED

Fully matured seed from purest strains known to us, grown in selected hand-rogued fields. We operate our own gin, carefully avoiding seed mixing.

All seed orders, whether car load lots or less, booked as received, shipments following consecutively.

Write for prices, stating quantity desired.

A Land of Milk and Money

It takes more than *honeyed* language to put your dairy-farm on a *moneyed* basis. It takes know-how! Breeding, cow-testing, feeding—that is the trinity of success in the dairy business. And—mind this: *Feeding* should not come last in your reckoning, either!

For it's the feed that shows up in the flow. It's the feed that, in the end, makes your herd profitable or unprofitable.

Nature has provided alfalfa hay or pasturage for your cows—that's good! But it doesn't go far enough. Because alfalfa, although a cheap source of protein, contains *only half* the carbohydrates required. Hence the need of a concentrated grain feed.

It has been demonstrated time and time again that you can't put your dairy on a real profit-basis unless you feed, in addition to roughage, a grain concentrate. And just

as alfalfa hay is the ideal roughage, so SUREMILK is the ideal grain concentrate. *Together*, they enable your cows to produce the greatest amount of milk at the lowest cost.

Feed SUREMILK and notice how it speeds up milk production and keeps your herd in "fine fettle" all the while. Your cows will "take" to it right off! Because it is a *mixture of grains*—and, therefore, more palatable. You can never expect any single grain to do what SUREMILK does. It *always* gives better results (increased milk and better "conditioning" of the animal) than any single grain.

If you want to see how SUREMILK can help to make *your* dairy-farm a land of milk and money, send for the new edition of our booklet, "Converting Feed into Money." It's free—simply fill in the coupon and mail today.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

EDITORIALETTES

There are times when we all feel we could materially improve the civil and even the criminal code of our state. Heretofore the farmers of the state have engaged in this pastime, or at least endeavored to influence legislators, and at every session of the state legislature various and diversified repeals, enactments and amendments have resulted. Beginning a year ago, the farmers in convention at Chico took first steps to bring together definite suggestions which should lead to more constructive agricultural legislation. The Agricultural Legislative Committee has now been in existence for over a year. This committee is bringing together and working out harmoniously suggestions which have come from all sections of the state and all, or at least many branches of California's diverse agriculture. This gives opportunity to those of us who have an idea as to how things should be run. We have no invitation from the committee to pass on suggestions, but we doubt not any constructive, workable suggestion which may be made by any farmer will be readily received. Of course any such suggestion should be something more than an expression of disgust with present conditions; there should be concrete suggestion which will result to the advantage of agriculture. The office of the committee is in the Ochsner Building, Sacramento.

The drouth is broken. The heaviest storm in a couple of years has visited the northern end of the state. The Sacramento and Feather Rivers broke their banks and thousands of acres of rice fields, ready for the harvesting, are flooded, and one report has it there will be a loss of at least 45 per cent in some of the rice producing counties. As we write, a second section of the storm seems to be moving down the state, which it is predicted will reach to the southern end.

* * *

It is now proposed to use the Panama Canal for shipping of citrus fruits. A bureau of the Exchange has been formed which will have to do with these canal shipments, and it is expected that a test shipment will be made within the next few weeks. With overland rates advancing and perfect refrigeration possible on shipboard there is no reason why a vast quantity of fruit should not go by way of the canal.

* * *

Imperial Valley cotton growers have already figured that their return from the season's crop will not be sufficient to cover the cost of the crop as it stands in the field. It is taking some nerve on their part to borrow more good money to hire more help to harvest and market this crop.

* * *

The National Rivers and Harbors Congress has issued its official call for its sixteenth convention to be held in Washington, December 8, 9 and 10. The time was when many of us felt that this organization was in existence to a large extent to hold jobs for a bunch of civil engineers whose work it was to direct the expenditure of vast sums on the waterways of the country. This may possibly still be true. However, with the fearful advance in freight rates and with highways making possible trucking of crops to river bank in many sections, it may be that relief may be secured, or at least partial relief, by encouraging congress to continue waterways improvement.

* * *

Nearly a dozen carloads of Californians are this week visiting in Mexico. The party is largely made up of Los Angeles tradespeople who are looking for extension of trade or an outlet for California productions. With the new president inaugurated and Villa subdued, as he seems to be, there is no reason why California and Mexico should not be the best of neighbors.

NEARLY DOUBLED

Notwithstanding the gentleman's agreement which has prevailed as to immigration of Japanese to the United States, California's Japanese population increased in the last decade, according to figures just given out by the census bureau, 28,840, or 69.7 per cent. The total Japanese population, as shown by the census, is now 70,196. The next state of the Union which has seemed attractive to the Japanese is Washington, which now has 17,110. Oregon's Japanese population is only 4,022. The number of Japanese women entering the state during the last decade is 25,832 as compared with 553, total number of Japanese women of the state in 1910.

Now come rumors from Washington that the new treaty being negotiated, or, as one rumor has it, already negotiated, provides that Japanese residents of this country shall be entitled to citizenship. Senator Phelan and others are sounding the warning and urging appeal to Washington.

ORANGES AND OLIVES

The fifth annual Oroville Orange and Olive Exposition has closed, and all agree it was one complete success and made a showing of semi-tropical fruits which was most interesting, especially to many Eastern tourists who attended. About the same distance from the north pole as is Philadelphia, Washington, Columbus, Indianapolis, Springfield and Denver, it was somewhat surprising to these visitors to witness the exhibits in the big pavilion and then to take a five minutes drive from that great structure across the Feather River and see the orchards from which the fruit came.

While the exposition was called the Orange and Olive Exposition, there were extensive exhibits of dried fruits especially of prunes and canned and processed fruits of nearly all kinds. The farm bureau made it an occasion for the gathering of centers from all portions of the country.

FARM BUREAU GATHERING

Secretary Mote of the County Agricultural Agents of the United States, writes of the annual convention of that organization in Chicago, November 29. Hoover and Secretary Meredith are both expected on the program. This is intended as something of a tuning up of the agents for the greater meeting to be held in Indianapolis, December 6-8, the convention of the American Farm Bureau Federation. This latter meeting has been declared to have promise of the greatest gathering of farmers yet brought together. The keynote of this great event will be cooperation. It is hoped that from it will come suggestions that may lead to closer organization on the part of all producers, and California will be cited many times as giving examples of successful cooperation. Farm bureau delegates from California are Messrs. Walker, Peters and Sawyer. The Cultivator is promised an early report of this great convention.

RICE GROWERS ORGANIZING

The Southern Rice Growers Association is one of the later cooperative organizations to get into successful operation. Rice growers of the South, as well as of California, have been finding rough sledding. They could neither borrow, nor sell, nor even gather sufficient money to bear harvesting expense. Now they are organized and able to borrow \$3 per bag on No. 1 and No. 2 "Blue Rose." Further, the organization is leading to something unheard of in good old Louisiana. The governor, staunch, life-long democrat, has developed into a thoroughgoing protectionist, and it appears the democrats generally are insisting that a protective tariff is no longer a partisan issue, and it is very probable that a tariff commission will settle the entire matter for us, so producers of California fruits and nuts, California beans and raisins, will have hearty support from Louisiana, Tennessee and a number of other representatives of the former "Solid South."

We are asking as to whether prices really are coming down. Mr. Spellmeyer suggests that "A Little Ford shall lead them" and that everything will soon be tumbling. The financial letter of one of the state's largest banks has suggested that "The government set the example of waste" and we have engaged in a "financial debauch." Meantime the farmers' prices are definitely taking a tumble. Likewise the shoe dealer is remarking, "It will be many moons before the present low priced hides are made into lower priced shoes."

"RED TOP" STEEL FENCE POSTS

America's Foremost
Fence Post

The "Red Top" Steel Fence Posts have earned the right to be known as the world's foremost fence post.

Millions of these permanent steel fence posts have been installed on Government property, along the right-of-ways of leading railroads and on thousands of America's best farms.

The "Red Top" has answered the every requirement of the three general classes of post users. It has given continuous satisfactory service under most adverse conditions and in each case it has made good.

Natural enough that today it is recognized as the world's standard fence post. Know this superior steel fence post. Identify it by the "RED TOP."

"Red Top" Fence Posts drive like a stake—Anchor like a rock—no concrete used for line posts.

A New Log Saw

Cuts Faster, Costs Less, Makes
More Money for Users and
Works While You Rest

A new improved power log saw, now being offered, outdoes all other log saws in cutting wood quickly and at little cost. A new 4-cycle, high power motor equipped with Oscillating Magneto—no batteries to fail you—makes the saw bite through logs faster than other log saws. It finishes its cut and is ready for another before the ordinary saw is well started. This log saw—the Ottawa—has a specially designed friction clutch, controlled by a lever, which starts and stops the saw without stopping the engine. Others have imitated, but no other power log saw has this improvement just like the Ottawa. The Ottawa Log Saw sells for less money than any power saw of anything like its size.

Patent Applied For
The Improved Model, 4-H.P. Ottawa Log Saw

One man wheels this outfit from cut to cut and log to log like a barrow. Separate attachments cut down trees and cut up branches. Extra power lets the engine do heavy work of all kinds. Owners of the Ottawa Log Saw laugh at coal shortages and are making big money with ease, the machine doing the work. 35 to 50 cords cut any day, rainy or dry, by one man, are normal figures. And wood is approaching \$20 a cord! The Ottawa is compact, simple and durable. It sells for cash or easy payments and is guaranteed. If you have wood to cut the Ottawa Log Saw will be the most satisfactory machine you've ever owned. We suggest that you write the Ottawa Mfg. Co., 2744 Wood St., Ottawa, Kas., for their complete new illustrated book and prices, sent free to all readers of this paper.

Los Angeles, November 27, 1920

One Dollar Yearly

ARIZONA'S sixteenth annual fair has passed into history. The total attendance was somewhat less than last year. The first two days, for some unknown reason, the visitors that filed through the gates were fewer in number than for many years, but for the four last days, ending with a tremendous crowd on Saturday, the 13th, the attendance was very good.

Exhibits were in most cases up to the usual standard. Some exhibits were surprisingly good and others noticeably light. With the decline in the dairying industry it was expected that the exhibit of dairy livestock would be slim. However, there was a splendid exhibit of fine dairy cattle, and from some of the most popular breeds, Holstein, Friesian, Jersey and Guernsey. This exhibit was especially encouraging as it showed that there is still a great deal of good stuff in the Salt River Valley. One herd of Guernseys was shown from California. Practically all the others were Arizona bred. There were some very good beef cattle, particularly Herefords. These were shown by a number of breeders, one large exhibit coming from Texas.

The exhibit of swine outnumbered any other exhibits in this class ever shown at the Arizona state fair. New hog barns were built several years ago, but these were inadequate to accommodate the number of hogs and the overflow was taken care of in the sheep barns, there being only a few sheep this year. The largest exhibits of swine were the Duroc-Jerseys shown from the Southwest Cotton Company. Large exhibits of Berkshires were shown from the Italian Vineyard Company of California. Quite a few hogs were shown from the boys and girls club contests, which added to the numbers on the exhibit. Speaking of the boys and girls exhibits there naturally follows mention of the high school boys state judging contest, in which more than 75 boys from the various high schools of the state were competing for honors in judging swine, horses, cattle and sheep. The Southwest Cotton Company offered a prize boar pig to the boy making the highest score in judging hogs. Phoenix high school received second with Omer McCullough, third.

A special premium offered by the Arizona Packing Company for the best pen of three fat hogs went to the Southwest Cotton Company on their nine months old pigs. These three animals were ideal for the making of juicy hams, bacon and pork chops. The judging was well done by Prof. E. B. Stanley, head of the animal husbandry department of the University of Arizona, and was handled in a creditable manner. Some good Poland Chinas were exhibited, and there were also a few Muir Foot hogs.

The agricultural and horticultural building was well filled and attracted a good deal of attention. Most counties were well represented, but it is becoming more and more apparent each year that there are two things which must be done. One is to build a new agricultural building and the other is to appoint a paid superintendent to keep in touch with the several

Arizona's Sixteenth Fair

By M. E. Bemis

counties and see to it that exhibits of produce are saved when matured and kept over and preserved for the fair.

Most of the counties made creditable showings. As usual, Yavapai County was awarded first prize, Coconino second, Maricopa third, Graham fourth, Greenlee fifth and Navajo sixth. The exhibit from Yavapai was particularly fine, with many varieties of fine apples. A considerable variety was also shown in corn. Santa Cruz made a unique exhibit of a portfolio made of ears of corn fashioned after the style of the entrance of the Santa Cruz

Healy, Mr. Doty of the Florence high school and Pinal County Farm Agent Turville. This year Pinal County won a profusion of first and second prizes, the most important of which were blues for alfalfa, sweet potatoes, milo, broom corn, pumpkins and seeds.

The supervisors of Maricopa County, through Fair Commissioner C. E. Fauley, offered nearly \$4,000 in special prizes. This offer was announced too late to call out as large a number of exhibits as if it had been announced earlier, but the Maricopa County exhibit was very good, particularly good

the best exhibit and the special county prize of \$100 offered by the county board of supervisors. G. R. Finch of Tempe took second premium in this class. In the short staple contest Albert Morris of Safford took first premium with his plant entry and Mrs. William Strawn of Safford captured first honors on short staple seed. Mrs. Strawn also had the best exhibit of short staple seed cotton in the lot.

Phil Ensign of Maricopa County was awarded several prizes for one of the finest individual cotton displays ever entered in a state fair. He took first prize on his exhibit of lint cotton, which the judges pronounced the best sample of this kind in existence. Ensign also went home with the sweepstakes in the Pima variety class, the \$100 special offered by the board of supervisors, the \$50 fair premium and two cups offered by the Southwest Cotton Company here. Another cup offered for the best lint display went to Ensign. The donor was the McCail Cotton and Oil Company.

Prize for the best exhibit of seed cotton was taken by Mrs. Anna Carnapas. The premium was offered by the Arizona-Egyptian Cotton Growers. A sweepstakes cup offered by the Chandler farm bureau for the best combined Pima exhibit was taken by J. W. Skousen of Chandler. Displays of Pima seed and lint cotton were particularly strong this year. There were 65 line entries and 35 competitors for the prizes offered for the seed class.

The poultry exhibit was the largest ever shown in Arizona. There was a good variety and the quality of the birds was most excellent in most cases. The three largest varieties shown were the Barred Rocks, Rhode Island Reds and Rhode Island Whites. Curiously enough, the display of White Leghorns was very small. With the popularity of this well known breed it would appear that there would be some breeders anxious to show the stock at an exhibit of this kind. The poultry was ably superintended by W. F. Fetterly. The judges, were N. E. Luce of the United States government poultry experiment station at Glendale and F. E. Emerson of California.

Farm implement dealers were given liberal space and this was one of the liveliest parts of the fair grounds. Many different kinds of tractors and other farm implements were shown and prospective buyers were given opportunity to study the advantages of competent machinery.

A week of real Arizona weather was most favorable for the fair management and left nothing to be desired in this respect.

STATE MARKETING OFFICIALS

The annual meeting of the national association of state marketing officials will be held in Chicago at the Auditorium Hotel, Monday and Tuesday, November 29 and 30.

The national association of state marketing officials was organized in February, 1920, when state marketing officials throughout the country gathered at the Murray Hill Hotel, New York City, for the purpose of forming an organization in order that their closer association might enable these men to better meet their problems of marketing.

On Arizona State Fair Grounds

Upper photo shows implement and power field on fair grounds while the lower shows procession of tractors just beginning to form. Photo by Bemis.

County court house. The quality of the rather small display of fruits, grains and vegetables bears witness to the fact that Santa Cruz, besides her special qualities as a grazing state, has important possibilities as an agricultural one. Pima County made a good display and showed that they are raising forage as well as other products. An unusual interest has been taken in dairy cattle in Pima the last year, therefore feed crops, as well as other crops, are of more interest than ever before. Pinal County, the region of the San Carlos, attracted attention by the design of her front piece, which announced in letters of cotton that she is the cradle of Pima cotton. Her display also included some 30 samples of this product, one of which received third premium for lint, and another fourth for plant. The balance of the exhibit consisted of almost everything grown. A special feature was some extra fine lettuce nearly ready for shipment, bearing a card announcing that it was planted September 9. Some 25 ribbons added color to the exhibit and bore witness to the excellence of the products. Credit for the display was given to the county fair commissioner, Ted

In some lines. When it is considered that cotton is grown on about two out of every three acres in the Salt River Valley this year, the exhibits shown were very creditable. One of the unique exhibits of the Maricopa County booth was that of Miss Grace Peck of Phoenix, who showed 59 varieties of fruits and vegetables grown in one home garden. Miss Peck was awarded a special prize for unique display and also a number of blue ribbons.

The cotton exhibit was made a separate department from the agricultural exhibit and this, under the supervision of H. C. Heard, Maricopa agricultural agent, was one of the special attractions of the fair. In addition to a display of cotton plants, seed cotton and cotton lint, there were shown some special cotton growing tools which were of interest to the farmer. Judges of the cotton exhibit were S. H. Hastings, W. G. Weiss and Warren H. Parker for the plants and Frank Devine, F. R. Behrends, B. B. McCail Jr. and Mike Moore for the lint. The following awards were made:

Prize plants entered by C. W. McCally took the regular fair premium of \$50 for the best, the Chandler cup offered by the farm bureau there for

Agricultural News Notes of the Pacific Coast

Northern California

Sacramento County pear growers have had serious trouble with blister mite.

R. L. Stanley has been appointed assistant county agent of Butte County.

Northern California citrus sections expect to ship out about 300 carloads of oranges.

The Santa Rosa County farm bureau started an egg laying contest at Petaluma November 1.

Fifteen per cent of the barley acreage of Yolo County this season will be planted to Mariout.

The Bangor district of Butte County reports some high class avocados ripening the past month.

Shipments of refrigerated turkeys from Australia have lowered the market on home grown fowls.

A large wool buyer estimates that at least 90 per cent of Pacific Coast wool is still in producers hands.

Oroville sent out its first shipment of Navels the first week of November. It went to Winnipeg, Canada.

The Placer County farm bureau marketing exchange has supplied several carloads of feed and seed to members.

Solano County recently made its first carload shipment of persimmons. They were marketed in New York City.

Placer County farm bureau centers will give special attention to formation of pig clubs among the youngsters.

Rice harvesting has been discontinued because of heavy rains last week. Serious loss was suffered by many of the growers.

Hop growers are generally reported to be holding for a 70 cent market. Some of the more optimistic insist, however, that they will secure a dollar.

The beekeepers of Butte County recently met at Chico and discussed marketing problems. The idea is to secure more favorable return from 1921 crop.

Formal opening of the Ehmann olive plant at Oroville took place on November 15, which was also the opening day of the Oroville Orange and Olive Exposition.

Farm bureaus of the Sacramento Valley have organized for cooperative marketing of fat hogs. Sales have been held at Woodland, Willows, Red Bluff and Durham.

Rice growers at Willows have made complaint against the warehouse service and representatives of the Pacific Rice Growers Association have been sent to investigate.

Rains are preventing shipments of hay. Plowing and seeding for next season's crop are proceeding as rapidly as possible excepting in sections where too much water prevents.

Rice producers and millers are conferring and endeavoring to secure for the growers more just price. Sales have been made as low as \$2.40 for No. 3 paddy. No. 1 is supposed to command \$3.08.

It has been advocated that an association of Western and Southern states be formed to discuss and devise means of restraining Asiatic immigration, and to preserve America to the white race.

Central California

175 bales of cotton was grown this season at Kearney Park.

Orange growers near Exeter, Tulare County, have begun picking.

The California Associated Raisin Company reports 1920 crop entirely sold.

The raisin and peach associations will join in erecting an office building at Fresno.

Rains through the valley have brought reassurance as to next year's water supply.

Beekeepers of Santa Cruz County have decided to organize a department in the farm bureau.

Oranges in the foothills near Springville, Tulare County, are said to be coloring up rapidly.

The second year of the farm bureau egg laying contest at Santa Cruz started November 1.

A local meeting of the farm bureau will be held at Happy Valley, Santa Cruz County, November 27.

At the farm bureau auction held at Tegner, November 2, 168 hogs were sold at from ten to 12 cents.

Farm bureau meetings will be held in Kern County at Weed Patch, December 6; Kern Delta, 8; McFarland, 10.

Farm bureau meetings will be held in San Cruz County at Soquel, November 24; Santa Cruz, 25; Happy Valley, 27.

M. E. Farthing of Turlock will take charge of the Merced headquarters of the state farm bureau grain marketing division.

Hog auction under auspices of the California Farm Bureau Marketing Exchange will be held at Modesto, November 30.

The fruit and vegetable inspection service of the state department of agriculture has opened offices at Lindsay, Tulare County.

It is reported that Herbert Hoover has invested in a large tract of land in Kern County, which will be managed by Ralph Merritt.

Chester H. Rowell of Fresno has accepted appointment by President Wilson as member of the United States Shipping Board.

Beekeepers of Santa Cruz County, after meeting at Watsonville, have decided to organize a bee department of the county farm bureau.

Commissioner Rouillard of Fresno County reports necessity of condemning one car of early oranges which were below required sugar test.

The Peach Growers Inc. has increased its capitalization from \$1,000,000 to \$3,000,000. The official name will be changed to California Peach and Fig Growers.

Tulare County farm bureau has increased yearly dues from \$2 to \$7.50 and has set aside \$5,000 to meet expenses of consolidation of the farm bureau with the Public Utilities Association.

Six electric stamping machines for use in placing Christmas greetings, brands and other advertising directly on the orange itself, have been installed in Lindsay the past few days by the American Fruit Growers, Inc., and between now and the holidays all citrus fruit shipped will bear the message, "Merry Xmas, Lindsay."

Southern California

The Santa Ana Walnut Association has wound up its seasons' shipping.

The Riverside County farm bureau will hold all day meeting at Elsinore, December 9.

Vegetable and melon men of Imperial Valley have incorporated as a marketing association.

Ventura County is disappointed over another delay in opening the highway over the Conejo grade.

Superintendent of Rodent Control Wardwell is planning to use ferrets in the work in Orange County.

Growers of Blackeye beans in Orange County are reported making sales at between six and seven cents.

The Hemet Orange Growers Association expects to close its first pool on Navels the first of December.

An order has been issued to weights and measures officials of the state, fixing weight of berries in containers.

The Orange County Fruit Exchange has purchased building lot at corner of Glassell and Almond Streets, Santa Ana.

The Santa Ana Walnut Growers Association has closed its first pool. Gleanings will go to make up the second pool.

Manager Oliver of the Imperial Valley Growers Association is calling for cooperation of banking and farming interests in the valley.

The annual report of the San Dimas Fruit Exchange shows total fruit shipments for the year ending August 31 of 856,739 packed boxes.

Horticultural Commissioner Coy of San Bernardino County reports finding fully matured cotton boll weevil in box thrown by the roadside.

The California Fruit Growers Exchange has appointed a special committee to investigate practicality of making citrus shipments via Panama Canal.

The Charter Oak Citrus Association has paid to grower members an average f. o. b. price on Washington Navels of \$4.27; average on all fruit for 1919-20 season, \$4.05.

The San Dimas Lemon Exchange at its recent annual meeting reelected former board of directors. The year just closed is reported the poorest since the 1913 freeze.

Proposal has been brought before the Pasadena city council to erect a huge dam in the West Fork of the San Gabriel and connect it with Pasadena by an aqueduct.

The plant of the California Packing Corporation at Santa Ana has already put up 40,000 cases of pimentos. It is hoped to continue canning operations till after January 1.

There was a large attendance of sugar beet growers from Orange and Los Angeles Counties last week at a meeting called at Santa Ana to consider formation of association.

Director Davis of the U. S. reclamation service met irrigators at El Centro, November 22, to discuss report on Colorado River project which will be made in Washington the first of December.

Horticultural Commissioner Call of Ventura County has named December 8 as field day to be devoted to study of natural control of black scale. This field day was originally planned for Thanksgiving week.

The Coast and General

Oregon reports early sown wheat showing up well.

Salem, Oregon, is planning for a big poultry show this winter.

Total enrollment of students at the University of Oregon is 1,669.

Branding and steer gathering are over in the Pinedale section of Arizona.

The new gin at Summerton in the Yuma Valley of Arizona is ready for operation.

Rains over most of the grazing sections of Arizona have greatly improved pasture conditions.

An irrigation project in Sonora, Mexico, proposes to put water on more than 500,000 acres.

One of the features of the Arizona state fair last week was a big tractor and implement show.

Fair weather and mild temperatures on the ranges of Arizona have been favorable to livestock.

Reports from the Middle West are that farmers find it cheaper to burn corn than to buy coal.

Large shipments of both sheep and cattle have been made from the Holbrook and Pinto sections of Arizona.

Arizona orange growing sections have about cleaned up fruit. About half the grapefruit is yet on the trees.

Eighteen counties of Oregon have formed units of the state federation of farm bureaus. The membership is now 5,000.

Arizona's cotton crop is said to be much better than last year and, owing to the absence of storms, remarkably clean.

Salt River Valley in Arizona has just about finished its olive harvest. Growers report crop light but of excellent quality.

Practically all of the oranges have been gathered in the Salt River Valley of Arizona. They are bringing good prices in Eastern markets.

The Oregon Growers Cooperative Growers Association has been sending carload shipments of fancy apples to Sweden, England, Scotland and Canada.

Sugar beet growing districts of France are planning a large increase in acreage during the coming season, the present estimate being over 200,000 acres.

An international dairy exhibition will be held at Buenos Aires, Argentina, during the month of May, 1921. It will feature dairy breeds, dairy machinery and dairy products.

The Columbia Basin Alfalfa Growers Association has completed permanent organization. A. L. Larsen of Boardman has been chosen president and Don Campbell of Hermiston secretary-treasurer.

By a vote of two to one Oregon turned down the marketing commission scheme of regulating marketing associations in that state. It was generally opposed by the Cooperative Marketing Association.

The value of the work of the Rogue River Cow Testing Association, Oregon, has been recognized by the Ashland chamber of commerce by a substantial cash subscription to aid in carrying on the work another year.

A California Peanut Story

By Ernest Braunton

THERE are many parts of California where peanuts may be grown equal to any, for the writer has pulled and eaten them green, in a thousand acre field, taken them home, roasted them and eaten them whole, in home-made candies and cookies, and all of them were good. The plant itself is attractive and interesting, particularly interesting, inasmuch as it belongs to the great pea and bean family, yet its pods grow within the soil and do not split open as do other pods. Its native home is in Brazil where seven or eight other species also grow in the wilds.

But we must get back from the wilds and into California fields. Peanuts crop best in a free sandy loam where the soil is warm and well drained and the season is long, for if Jack Frost nips the plant development ceases. Soils containing much lime bring best results and if low lying and inclined to dampness should be given 500 or 1,000 pounds of lime per acre before planting. Wood ashes, being about one-fifth lime, are also excellent, for peanuts on poor soils need food, and 500 pounds per acre of complete fertilizer will assist much. Fresh manure should not be used on peanut land unless applied one year previous to cropping with nuts.

Where They Grow

The heaviest grower of peanuts in California is A. B. Miller, of Fontana, San Bernardino County, where, in many miles square of diversified orchard and field crops there were grown during the past summer 3,000 acres of "goobers" or peanuts. The soil is light and sandy but is plowed as deeply as possible and made smooth, for peanuts are planted on the level, not on ridges. Fertilizing has not been practiced yet for, like all legumes, the peanut draws heavy supplies of nitrogen from the air and thus figuratively feeds itself. The variety planted is the Spanish and the time of planting usually is from April 15 to May 15.

The nuts are planted in the shells, in rows 30 inches apart and from four to eight inches apart in the row. They are covered about two inches deep, not more. The machine used is an ordinary bean planter but with parts especially cast, of larger pockets, to

carry peanuts instead of the much smaller bean. The amount of seed necessary is 60 to 70 pounds to the acre and the machines plant four rows at a time. Eight inches apart is an ideal spacing for plants, but where one does not sprout the loss of ground is too great so the aim is to plant closer, or four to eight inches.

Culture and Care

As soon as nuts are planted the soil

corn and beans. Weed control is of course not a serious problem in real sandy soils. The later cultivations should throw the soil toward the rows so the nuts have a deep loose soil mass in which to develop.

When harvest comes, which on the Fontana ranch lasts six weeks, it may range from September 10 through October to November 15. The bean machinery is again used, the cutters har-

over the field, which throws five of the winrows or double rows into one, two from each side. This method also shakes much of the soil from plants and nuts, quite a necessary cleaning. The vines are allowed to lie for 24 hours before stacking or staking so they may somewhat dry.

Curing and Threshing

Peanuts are quickly and easily injured by rains so staking is resorted to. Stakes two by two inches and eight feet long are driven into the soil nearly or quite two feet where every 20th row had grown, or 50 feet apart. Down the rows they are placed 60 feet apart for the average crop. On the base of these stakes and eight inches above the soil laths 30 inches long are nailed on all four sides. A man with fork throws plants from big rows toward stakes and another stacks them. He begins by placing the "nutty" end on the cross bars and builds thus round and round the stake to the top. If rains come these stacks quickly dry out for the nuts do not touch the soil and their looseness next the stake leaves an air shaft through the stack so rains do not discolor and mildew cannot find harbor.

The threshing is done on the Miller ranch by three remodeled bean threshers which are fairly satisfactory. The yield for 1920 averaged 1,500 tons of nuts and the same weight of straw to the acre, the latter being of equal food value with alfalfa, to which it is a near relative. From the thresher the nuts go in sacks to the shelling plant, just installed under the supervision of an expert from Fort Worth, Texas. Here the sticks, stones, empty shells, pieces of vines, etc., are easily eliminated. Then the peanuts are made to dance on a vibrating deck which separates them, largely by specific gravity, (air being forced up through the perforated dancing floor) into three grades. Grade one is the whole nut, which retails as "salted peanuts"; grade two is the cracked and half nuts, which go to the confectioners and peanut butter plants. The shriveled and low grade goes to the oil mill.

California nuts are all marketed on the Pacific Coast and the demand is greatly in excess of the supply for large shipments arrive weekly from Texas and Georgia.

Harvesting Peanuts at Fontana

1. Cutting and winrowing. 2. Staking and stacking. 3. Hauling and threshing.

is irrigated, and at Fontana the second watering is given 30 days later. Then, in normal seasons, one or two more irrigations are given 15 days apart, depending on soil and season. Soil moisture is a very important matter and a deficiency will result in failure of an early crop though the plants are very responsive and will set a later crop if soil is wet enough. The general culture is similar to that for

vesting two rows at once, and by an arrangement of light iron bars in the rear the plants are thrown into one winrow. The crop is within two inches of the surface so knives do not run deep in the soil. Harvest time may vary with maturity for 90 per cent of the pods should be hard on the tip and the skin and meat of pinkish hue before ready for digging. After plants are dug an end delivery rake is run

"Driver Trouble"

By James De Camp

a reasonable period with a minimum of time and expense for repairs. The owner who bleats of knocks, burned out bearings, chipped gears and kindred ailments is usually forced to admit that his own or another's negligence has caused the trouble. If his complaint discloses a defect in the tractor the agency will gladly adjust the matter.

Tractioning, as some choose to call it, is an occupation requiring a certain amount of practical mechanical knowledge and a first-hand understanding of the capabilities and peculiarities of the gasoline engine. The matter with many tractor operators is that they are still living in the age of horseflesh and believe that all they need to do is hitch on the imple-

ment, throw in the clutch and go to it. The horse knew enough to stop when he became "all in," but the tractor is without volition and subject to the mercy of its driver.

Owners who operate their own tractors usually have taken the trouble to study the proposition thoroughly and have mastered the principles of lubrication, carburetion and ignition. Perhaps they have neglected the tractor schools and instruction books and learned their lessons through the painful medium of the repair bill, but nevertheless they understand that their "steel horses" require a certain amount of constant attention and consideration.

But the case is quite the reverse with the newly hired hand who doesn't

understand the difference between drawbar pull and horsepower. In these days of scarce labor the new man is usually greeted with acclaim and shown great consideration. In placing him on a tractor the owner too often seems content to ascertain merely that the employe knows how to start and stop the machine. He seems to take it for granted that some mystic force is imprisoned beneath the hood that will keep the tractor on the job whether it be handled intelligently or is mercilessly beaten and flogged. If trouble develops the owner usually bewails his misfortune in having selected this particular make of tractor and threatens to trade the machine for such and such a make which Jones or Smith is using.

When one stops to consider the vast amount of advisory literature and (Continued on Page 701.)

THE other day I was chatting with one of the largest growers of deciduous fruits in the state. More than a dozen tractors of various types and capacities are operated on his acreage. Our preliminary conversation concerned several specific makes of machines. Eventually we veered round to the subject of securing competent help and my friend made the following statement:

"We find that nine-tenths of our tractor trouble is driver trouble."

I believe that anyone who operates a brace or two of tractors will agree with me that he hit the situation in the solar plexus.

The manufacture of most automotive products has progressed to a point where almost any piece of equipment that is not grossly overtaxed or abused by neglect will deliver the goods for

WE WISH to announce the removal of our factory and General Offices to Downey road just north of Slauson Ave., where larger quarters and added facilities will enable us to render more efficient and quicker service in handling your orders.

We also wish to announce the appointment of the following distributors for our products:

**KILLEFER

TREE SURGERY DESERVES WIDER RECOGNITION

At present tree repair work has not received the recognition and approval from tree owners that it deserves. This may be due at times to unfavorable experiences with dishonest or ignorant tree surgeons, at other times to the reluctance of the owners to spend much money in preserving their trees, or from their ignorance of the benefits that may result when tree repair work is properly done.

Reliable tree surgeons are doing much in a practical way to educate the public as to the benefits of tree repair work. A few states have laws regulating tree repair work on a commercial basis.

The United States department of agriculture invites correspondence concerning methods of tree repair work and is prepared to advise for or against any particular method so far as experience and the results of experiments permit. Farmers Bulletin 1178 on tree surgery will be sent free on application.

Tree owners are urged to remember that the necessity for tree repair work 15 or 20 years hence may be reduced materially by promptly attending to the fresh injuries of today.

Most persons can, at least with a very little preliminary practice on the simpler types of work, undertake ordinary tree surgery provided they are familiar with the use of a gouge and mallet, a saw and a paint brush. A steady head and ability to climb will be necessary for work in the top of the tree.

A badly diseased or injured tree should be removed and replaced by a healthy one unless there is some very special reason for trying to preserve the tree.

Two axioms of tree repair work that should be borne in mind constantly are: that prompt treatment of freshly made wounds is the surest and most economical method of preventing disease and decay in the future, and that all wounds made in tree surgery should be cleaned, sterilized and protected from infection just as thoroughly as in animal surgery, and for the same reasons.

AMERICAN FARM BUREAU FEDERATION CONVENTION

The American Farm Bureau Federation will hold its annual meeting at Indianapolis December 6 to 8. This will be an outstanding meeting for agriculture and perhaps the meeting will eclipse any convention ever held by farmers in the United States. Some of the most prominent English and American agricultural leaders are on the program for the convention and nearly 200 of our best economic and farm leaders will be in attendance at the convention through special invitation.

California delegates who will attend are Dr. W. H. Walker, president of the California Farm Bureau Federation, Glenn County; R. B. Peters, San Bernardino County; George H. Sawyer, Stanislaus County.

SPRAYING DEMONSTRATIONS

The Los Angeles County farm bureau and extension staff of the agricultural college will conduct spraying demonstrations as follows: Monday, December 6, Gallatin schoolhouse, Downey, 2 p. m. (includes Clearwater and Hynes districts); Tuesday, December 7, 2 p. m., place of N. H. Denny, Lankershim; Wednesday, December 8, 2 p. m., Van Nuys, places of W. F. Clarke and C. W. Potter; Thursday, December 9, 10 a. m., place of Glen Allard, Zelzah; same date, 2 p. m., place of J. C. Craig, Owensmouth; Friday, December 10, 2 p. m., place of J. D. Radcliffe, Burbank.

In connection with the new packing house which has just begun operations near Phoenix, Arizona, yards for fattening cattle have been established which will accommodate 2,000 head of cattle at one time. All of the cotton seed from one of the mills has been contracted for to supply the feed yards.

More than 100 varieties of fruit are being experimented with at the Salt River Valley experiment farm near Mesa, Arizona.

Advance Announcement

BEST **TRACKLAYER** "Thirty" TRACTOR

Due to the insistent demand of farmers and orchardists upon the C. L. Best Gas Traction Company for a high grade tractor that could be used where the power required did not justify the purchase of a Best Tracklayer Sixty, the Company has perfected a 20-30 Horse-power model of practically the same design as their famous "Sixty"

AFTER months of trials and tests, this model is declared an exceptionally high-grade tractor, and factory production has been started. The design and materials used in this new "Thirty" are the outcome of a decade of high-grade tractor-building experience, and the knowledge gained by the successful operation of the Company's various models in the field. With each model, improvements have been made until today the "Thirty" stands a mechanically perfect tractor.

This new model is especially adapted to orchard work. It is small, compact, turns in its own length and is very easily managed. It will also eat up practically any belt job to which you may put it.

Working parts of the "Thirty" are entirely enclosed, and all gears are run in a bath of oil. Anti-friction bearings are generously used at points where long manufacturing experience dictates. Manganese steel tracks insure long life to the truck units. All working parts, though enclosed, are easily reached. The power is generated from a Best motor

—a motor which has long been recognized as the leader in heavy-duty tractor motors—bore $4\frac{3}{4}$ ", stroke $6\frac{1}{2}$ ", valve-in-the-head. The following additional description of the new "Thirty" will prove interesting:

Power Rating: Twenty h. p. at the drawbar, 30 h. p. at the pulley.

Speed: High, $3\frac{1}{16}$ M. P. H.; low, 2 M. P. H.; reverse, $2\frac{1}{2}$ M. P. H.

Dimensions: Length (not including seat), 9' 4". Height, top radiator, 59". Width over all, $11\frac{1}{2}$ " shoes, $53\frac{1}{4}$ ". Width between tracks, $30\frac{1}{4}$ ". Ground clearance, $11\frac{1}{2}$ ". Drawbar, $16\frac{1}{2}$ " high. Track centers, $41\frac{3}{4}$ ". Standard equipment, $11\frac{1}{2}$ " shoes. Length of track on ground 60". Stationary Drive: Standard pulley, diameter 12", with a 7" face. Pulley speed, 800 R. P. M. Belt speed 2513' per minute.

Weight: 6700 pounds.

Write for full information, specifications, prices and name of nearest dealer.

Storage of Perishable Fruits

California growers of small fruits are generally forced to sell at any price offered at the moment the fruit is ripe, but now it is found that even these small fruits which are so quickly perishable may, by refrigeration, be held for a long period. The plan has been tried of freezing the fruit, that is, instead of holding at 32-35 of putting it in a temperature of, say, ten degrees, and freezing solid. It is then held at this low temperature until time for canning or for disposing of it arrives. The fruit is not so attractive in appearance as the fresh fruit, hence may not be used exactly the same as fresh fruit on the table, but it may be used in cooking, for soda fountain syrups, etc.

The book is written by W. B. Cruess, E. L. Overholser and S. A. Bjarnason. In summarizing the bulletin, the authors say:

Soft fruits such as apricots, cherries and berries can be preserved at cold storage temperatures of 32 degrees Fahrenheit for not more than a week to three weeks. Present commercial methods of storing these fruits at temperatures lower than 32 degrees are not standardized and are in many cases unsatisfactory.

These fruits if held in water or

syrup at eight to 12 degrees retain their flavor and color very well for at least a year. Lots of certain of these same fruits held at eight to 12 degrees in open containers without liquid in time lose color and flavor. This is especially true of cherries, which become brown, and of apricots which in time develop a disagreeable "cold storage" flavor and a brown color. Berries in open baskets retain their color and flavor very well.

The crushed fruits with or without sugar retained their color and flavor almost perfectly at eight to 12 degrees for almost a year; the duration of these tests. This fruit was excellent for ice cream, for pies, for use as a jam on bread, for shortcakes and general soda fountain use.

Grape juice stored at eight to 12 degrees was very much superior to the juice preserved by pasteurization.

Former brewing plants are well equipped for undertaking the storage of soft fruits and fruit juices by the methods discussed and recommended in this report. The storage of these fruits should form a profitable method of utilizing such otherwise idle equipment.

The storage of these fruits will be studied further during the present fruit season.

Orange Standardization Law

The season is somewhat earlier than last year and it seems desirable at this time to point out the requirements of the fruit and vegetable standardization law for this commodity.

Oranges which are substantially at least 70 per cent colored at the time of picking shall be deemed properly matured for shipment or sale, irrespective of analysis of the juice. No oranges are permitted to be shipped to points in the United States or Canada which have not attained at least 25 per cent yellow or orange color before picking, and such stock shall be deemed properly matured for shipment or sale when the juice contains soluble solids equal to or in excess of eight parts to every part of acid contained in the juice, the acidity of the juice to be calculated as citric acid without water of crystallization.

Oranges when packed, shipped, de-

livered for shipment, offered for sale or sold, shall be virtually free from insect and fungus pests and from other serious defects. This means that the total defects shall not exceed ten per cent in any one package.

Shipments to foreign countries other than the Dominion of Canada do not have to meet the above requirements if made after the first day of November.

To summarize: As far as color is concerned, oranges that show 70 per cent color do not have to meet the 8:1 test. All other oranges must have attained at least 25 per cent yellow or orange color before picking and in addition must meet the 8:1 test. Early picking of green fruit and sweating for color should be discouraged. Such stock should be tested carefully by county commissioners in orange shipping sections.—F. W. R.

Legal Weight of Small Fruit

An order fixing a standard of weight for berries when sold in containers, and general instructions relating to their enforcement, have been issued to weights and measures officials of the state of California by C. G. Johnson, state superintendent of weights and measures. The order follows in full:

Therefore, in the exercise of the powers conferred in section 6 of the Weights and Measures Act, I hereby fix the following standards of weight for berries when sold, offered or exposed for sale in containers, and prescribe therefor the following tolerances, and any persons violating such standards or tolerances shall be guilty of a misdemeanor:

Strawberries (pint 33.6 cu. in.) 12 oz. minimum contents. Tolerance 3/4 oz. in deficiency, 2 oz. in excess.
Loganberries (pint 33.6 cu. in.) 12 oz. minimum contents. Tolerance 3/4 oz. in deficiency, 2 oz. in excess.
Blackberries (pint 33.6 cu. in.) 12 oz. minimum contents. Tolerance 3/4 oz. in deficiency, 2 oz. in excess.
Raspberries (1/2 pint 16.8 cu. in.) 8 oz. minimum contents. Tolerance 1/2 oz. in deficiency, 1 oz. in excess.

Berries when sold, offered or exposed for sale in baskets in accordance with the standards herein fixed and packed in crates, chests, drawers, or other carriers, shall, for the purpose of effecting the practical operation of these standards, be considered as subcontainers, and such crates, chests, drawers, or other carriers, wherein such standard baskets are packed, shall be considered containers within the meaning of the net container act, and shall declare thereon the number of baskets, together with

the standard of weight for berries when packed in containers as herein fixed.

Berries of a different variety than those for which standards are herein fixed, when sold in containers, shall declare on such container the true net weight of the contents thereof, as required by the net container act.

These standards of weight are now in force and effect.

For the purpose of inspection the following tare for berry baskets is recommended: Pint baskets, 1/2 oz.; half pint baskets, 1/3 oz.; half pint baskets, tin top, 1/2 oz.

HORTICULTURAL COMMISSIONERS ELECT OFFICERS

The State Association of County Horticultural Commissioners, which recently met in Fresno, elected the following officers for the coming year: William Gould of Yolo, president; H. J. Ryan of Los Angeles, vice-president; Fred Brosius of Sacramento, secretary.

A subscriber at San Luis Obispo, Henry A. Fritch, writes of having seen in Australia some of the fearful ravages of what we know in California as the Mediterranean fruit fly and urges all California producers to use greatest care to prevent this pest ever getting a foothold in the state. This pest has been intercepted at San Francisco and it is hoped it will never get a foothold. We know the quarantine service is exercising every possible precaution.

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILD-DEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand and Fleur de Soufre, packed in double sacks, are the fluffiest

and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men \$5 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill into the soil 110 pounds per acre of TORO BRAND SPECIALLY PREPARED AGRICULTURAL SULPHUR—or our DIAMOND "S" BRAND REFINED POWDERED SULPHUR. This soil treatment has increased various crops up to 500%. Send for Circulars No. 6, 7 and 8.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur, Mixtures, etc.

Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR CO.
624 California Street, San Francisco, Cal.

We are equipped to make immediate shipments. Send for Price-list and Samples.

New and second hand pipe and casings. Riveted steel pipe, valves and fittings. Mail orders given prompt attention. Write, phone or call.

2025 Bay St., Los Angeles, Cal.

LAKE COUNTY ORCHARDS

The principal orchard crop, and the one of which Lake County is most proud, is pears. One 15 year old orchard in Scott Valley yields from 700 to 800 pounds of choice fruit to the tree, which sold for eight cents a pound. Another orchardist sold his crop at Hopland for \$100 a ton. A friend of the writer at Kelseyville sold his crop in the orchard, but picked and in lug boxes for \$90 a ton, but some were small in size, some were "frost ringed," the situation being somewhat cold. The orchard of Mrs. N. Hurlbutt, near Kelseyville, is said to have yielded a crop worth \$1,000 an acre in 1919.

A small orchard of gigantic cherry

Lake County Pears

Four year old tree on Shirley ranch, Kelseyville. Not fertilized, but stubble of Sudan grass plowed under each year.

trees on the Sanford ranch was visited and a tree photographed which had borne more than a ton of cherries at one crop. Leonard Coates, a veteran nurseryman, now retired and living at Lakeport, was visited and asked wherein the local prunes differed from those which have made the Santa Clara Valley famous. He stated they were much bluer in color and smaller in size, yet the writer found orchards near Kelseyville that have paid well for a number of years. Mr. Coates believes varieties may be found that are better adapted to this section than those generally planted.

Apple trees 40 feet high were found that still were in good vigor and bearing large crops. It is evident to one visiting this section that it has grown a considerable variety of deciduous fruits for nearly, perhaps fully, a half century. On the slopes of the foothills vineyards are common to all sections, while in the lower floor of the valley, about Clear Lake, cereals are the principal crop.—E. B.

"DRIVER TROUBLE"

(Continued from Page 697.)

the number of tractor schools and institutes available to everyone, as well as the service departments conducted by most agencies, there is little excuse for the misuse of a tractor. The owner must inevitably come to know the capabilities and possibilities of his machines and he should spend a half day, if necessary, in the field with a new man making sure that his property is being used intelligently and not wrecked.

If several tractors are in use one particular man should be made responsible for the care of each piece of equipment and a record kept of upkeep expenses and fuel consumption. A farm or ranch large enough to boast a machine shop will of course keep track of such matters readily, but the man with two or three tractors must use some little effort and diligence in making sure that his operators are using the machines carefully and caring for them in a competent manner.

Those with a finger on the pulse of the tractor industry predict that the care and operation of tractors will soon be a recognized profession, with returns lucrative enough to attract a competent, well prepared class of labor.

Your Hired Man

A box of Hercules Farm Dynamite under your arm, some caps, a coil of fuse and a few tools make the best hired man you ever had—a man who will labor with the strength of Hercules, on every working day of the year—*and ask no wages.*

It's easy to put this helper to work, for leading Hardware and Implement dealers everywhere sell

HERCULES FARM DYNAMITE

And it is easy to learn how to use dynamite for the Hercules Powder Co. publish a 68-page illustrated book "Progressive Cultivation" that they will send free to any orchardist or rancher who sends in the attached coupon.

This book tells you how to plant trees, cultivate bearing orchards, clear your land, dig ditches and do scores of other things with the help of explosives.

Send for "Progressive Cultivation" today—you need this book.

Hercules Farm Dynamite is for sale by leading Hardware and Implement Dealers

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Federal Farm Loan

Please tell me where and how to make application to the federal farm loan bank for a loan. Can you give me some of the conditions regarding same? What is rate of interest, etc.?—Subscriber, Oxnard.

It is not possible at this time to secure loan through the federal farm loan bank. The operation of the bank has been practically suspended pending settlement of suit brought by mortgage companies of the West in an effort, it is alleged, to destroy the usefulness of the federal farm loan. In any case, it is now many months since the action was first brought and no decision has yet been rendered, but from conversation with members of the bank at Berkeley it is indicated that a decision will be rendered before the first of January. In case this is favorable to the continued selling of the bonds and operation of the bank then it will be necessary for one desiring a loan to become a member of the farm loan association. This association will have an appraising com-

mittee which, in conjunction with the appraiser of the bank, will determine the amount which may be loaned on any particular place. If this amount meets the needs of the applicant the loan is made. Unfortunately, the time required to secure action has been discouraging to some and we doubt not when more experience is had the bank will be able to conduct these operations with less of delay.

Spraying Apple Trees

What should I spray my apple trees with?—Subscriber, San Dimas.

With no information as to what the trees are infested with, this is very difficult to answer with any degree of satisfaction, but, assuming there is possible infestation of San Jose scale, we suggest that as soon as the leaves are entirely off and trees are pruned we would give a thorough spraying with strong lime-sulphur solution. If the commercial solution is used, use one gallon of the commercial solution to nine gallons of water. Then in the springtime a spraying with Bordeaux will lessen trouble with scab and other fungus. As soon as the trees come into bloom they should be sprayed with an arsenate solution, formula for which was given in special spray num-

ber of the California Cultivator, August 9, 1919. This formula will be repeated at blossoming time, when it will be of value to apple and pear growers.

Killing Stumps

Can you tell me something to put into stumps that have been cut—pepper, lemon or eucalyptus—to kill them and stop them from sprouting?—Subscriber, Riverside.

Perhaps the best control of this sprouting habit of some stumps is to break them off with mattock or old axe. This at least would be far cheaper than any chemical treatment. However, in order to make the stumps burn more readily a large auger hole, or several of them, bored well down into the stump and filled with saltpeter, is effective. If this is applied and the sprouts kept off it is reasonably sure that at the end of the first year, with a little excavation around the sides of the stump, with a brisk fire of sticks or brush to start it, the stump may be entirely consumed.

Eradicating Morning Glory

Please be kind enough through the columns of your paper to advise best way to eradicate wild morning glory, also how to get rid of tame morning glory. The former is getting started in sandy soil which has blown in on 'dobe. The latter has almost taken

possession of entire space around my house. Is there any successful method of getting rid of both without being deprived of the use of the land infested?—Subscriber, Redondo.

Of course any chemical used in destroying the morning glory is reasonably sure to destroy the soil for the time being for any other crop. The arsenicals and iron and copper sulphate, together with common salt, have all been used in the effort to destroy morning glory. It has been found that while salt placed a few inches deep over morning glory has prevented its growth, second applications have sometimes been required. The salt treatment and spraying with chemicals are destructive of the soil for the time being and the treatment is expensive. Really, the most satisfactory method is the growing of beans, garden crop or some crop which permits of clean culture, then thorough cultivation at least every five or six days with hoe to remove any of the morning glory which shows up between plants will eradicate the pest and give a method of culture which will perhaps prove profitable if the right kind of crop is grown. Two seasons of this clean culture will suffice.

Green manures save time, expense, special equipment and inconvenience.

EARLY COVER CROPS ENRICH THE SOIL

IMMEDIATE PLANTING of the variety of legume best suited to your purpose insures a healthy stand and vigorous root-growth throughout the winter.

The soil becomes thoroughly permeated with a dense mass of fibrous roots bearing the precious nodules of nitrogen.

The texture of the soil is greatly improved by the root action and the addition of the humus and nitrogen to the soil.

Orchards, or any crop following the plowing under of a cover crop, quickly show the wonderful benefits derived.

FAVORED VARIETIES ARE:

FOR SALE

Famous Riverside Valencia Sweet Spanish Onion Seed

Are you looking for immense possibilities from your land? Then plant our Sweet Spanish Onion Seed and grow more tonnage to the acre, and get a better price for your product. The industry is new and cannot help being a winner.

California will eventually supply the Eastern markets with these onions. It has been proven that our soil is well adapted to grow a superior onion to those now shipped from Spain.

Sample packages 35 cents. Write for quotations on seed by the pound.

W. T. Thompson & Son

203 Citizens National Bank Bldg.

Riverside, California

agricultural station or college?—Subscriber, Redondo.

There are several experimental plots on farms in all parts of California. The director of the state station, however, should be addressed at Berkeley, care College of Agriculture. Some of the work of the station is done on the college grounds at Berkeley, some at the university farm at Davis, some on the university farm at Kearney Park, Fresno County, some at the citrus experiment station at Riverside, and other parts of the state.

Arsenical Weed Killers

Please tell me as to the advisability of spraying ditch banks with the arsenic spray to keep clean of weeds. Am I apt to poison my stock? How long will the spray keep the ground clean? What is the exact formula for this spray? How much does it cost?—Subscriber, Durham.

A satisfactory method of weed control through spraying with chemicals has not yet been perfected. It has been thoroughly investigated, however. George P. Gray, formerly with the state university, now of the department of agriculture, has given more or less attention to this subject for a number of years. Circular 168, which may be had by writing Agricultural Experiment Station, College of Agriculture, Berkeley, will have interest for anyone who wishes to investigate. The department of agriculture at Washington, D. C., has also issued bulletins on this subject. It is touched upon slightly in Farmers Bulletin 660, "Weeds, How to Control Them." On ditch banks greatest care would have to be used in preventing stock from drinking water from the ditch.

Aphis

What remedy can you suggest for green aphis on young cabbage plants recently planted?—Subscriber, Arroyo Grande.

Perhaps the best treatment for these aphis is the ordinary spray of nicotine sulphate, proportions for use being given on the package, the material to be mixed with cold water and sprayed as soon as the aphis appears. There is also an excellent trade preparation of nicotine and kaolin which, dusted over the plants, aids in controlling the pest. If in the garden where water is under pressure, hosing the aphis off the plants is effective.

Restoring Soil

Have recently pulled a row of encalyptus trees which bordered a piece of ground on which I wish to raise alfalfa. Kindly advise best method of treating the impoverished soil before planting the alfalfa.—Subscriber, San Diego.

Heavy application of stable manure with deep plowing will perhaps restore this soil. If manure is not available the ground could be given up to green manure crops for the first year, the

crops being given ranker growth by use of commercial fertilizers.

Sawdust in Manure

Will sawdust mixed through manure damage the orchard or do it good?—Subscriber, Redlands.

Presumably there would be no injury. If the sawdust is from redwood and applied while green or still full of sap, in large quantity, the tannin or other material proves injurious, but in small quantity, as it would be used as bedding in a stable, even redwood sawdust would probably be harmless. Other than redwood there is no injury in sawdust or fine shavings. This material, however, is inert and of no particular value to the soil of the orchard excepting in case of very heavy soil there is some mechanical advantage in that soils are lightened up and ir admitted by their use.

Dewberries

Can you tell me how to set out early dewberries and what kind? Do I have to plant more than one kind for a small patch?—Subscriber, Buena Park.

Dewberries may be set out at any time during the next three months. In your section the Gardena dewberry, really a trailing blackberry, is no doubt the better variety. They are self fertile and need no other variety near them, though it should be borne in mind that no fruits are harmed and many benefited by cross-pollination. It is often necessary for almonds, chestnuts and Satsuma piums, advisable with Bartlett and other pears and beneficial to many fruits. The distances apart for planting have a wide range. Commercial planters, where horse cultivation is practiced, often plant six by six feet. In home gardens three by three is sufficient. Mr. Gray, originator of the Gardena dewberry, planted still closer and each year, after bearing, cut the vines entirely away, two or three inches below soil surface.

Potato Curly Leaf

I have some potatoes that were planted in August and are now four to eight inches high. The leaves are curling, turning yellow and have black spots on them. Can you advise as to cause and remedy?—Subscriber, Redondo.

Your plants have curly leaf, for which there is no remedy after it once appears. Dipping seed in corrosive sublimate may help, but the trouble is inherent with the seed. Under no circumstances use any of your potatoes for seed unless from hills of unusual vigor and productivity showing no signs of curly leaf or other trouble. The only permanent combative measure used by commercial growers is seed selection. Black spots and yellow color in such juvenile foliage are unusual but probably due to poor condition, unless a light frost has visited your section.—E. B.

80 REGISTERED 80 HOLSTEINS

At Public Auction State Fair Grounds, Sacramento, Cal. Thursday, December 16, 1920

This offering will contain some of the highest record, most richly bred females offered in California this year, many of them heavy with calf to some of California's outstanding sires, and includes the complete dispersal of two herds—R. F. Fisher and J. McKindley. Just consider these females and family groups:

A 1,028 POUND YEARLY RECORD granddaughter of King of the Pontiacs, out of a daughter of King Hengerveld that was junior champion at 1911 California State Fair. This record was recently completed and she will freshen again before sale as a 7 year old.

FOUR DAUGHTERS OF THE ABOVE COW, including a junior 4 year old sired by a son of De Kol of Valley Mead, on yearly test with 650.87 lbs. butter to her credit in 298 days.

TWO DAUGHTERS AND ONE SON of the above mentioned 4 year old. A GRANDDAUGHTER OF KING OF THE PONTIACS with 764.86 lbs. butter from 1,940.3 lbs. milk in 305 days. Due to freshen again in January.

THREE DAUGHTERS AND ONE SON OF THE ABOVE COW, one of them a 25.56 lb. junior 3 year old with 424.53 lbs. butter and 10,283.3 lbs. milk to her credit in 143 days.

A 32 POUND GRANDDAUGHTER OF COLANTHA JOHANNA LAD, heavy with calf to the three times grand champion bull King Segis Alcartra Prilly.

A 27.84 POUND 3 YEAR OLD daughter of Prince Gelsche Walker Korndyke, due in January to King Segis Alcartra Prilly.

A 23 POUND THREE YEAR OLD daughter of Sir Rag Apple Korndyke, out of a 26 lb. 4 year old granddaughter of De Kol 2nd's Butter Boy 3d, heavy with calf of King Segis Alcartra Prilly.

A 2 YEAR OLD DAUGHTER of King Segis Alcartra Abbekerk due with first calf in January to a 35 lb. yearly record son of King Segis Alcartra Prilly.

TWO 21 POUND DAUGHTERS AND ONE 21 POUND GRANDDAUGHTER of Tidy Abbekerk Prince, bred to Sir Aaggie De Kol Acme, son of the world's official record butter cow Aaggie Acme of Riverside 2nd.

A DAUGHTER OF THE TWICE 34 POUND COW GERBEN ABBEKERK MAID, with 25.77 lbs. butter in 7 days as a 3 year old. She will be fresh again before sale.

A 23 POUND DAUGHTER OF CHANGELING BUTTER BOY out of a 26 lb. daughter of a 26 lb. cow. Bred to a son of Sir Aaggie De Kol Acme.

A DAUGHTER OF SEGIS PONTIAC DE KOL BURKE, out of a 26 lb. 3 year old daughter of King Mead of Riverside that made 644 lbs. butter in one year as a 2 year old. Bred to a son of Sir Aaggie De Kol Acme.

A GRANDDAUGHTER OF ARLIA DE KOL out of a 768.29 lb. yearly record daughter of a 1,025 lb. cow whose dam in turn made 1,008 lbs. butter in one year. Bred to a son of Sir Aaggie De Kol Acme.

A DAUGHTER OF KING AAGGIE MEAD, full brother to the world's official yearly butter record cow Aaggie Acme of Riverside 2nd, out of a granddaughter of Tilly Alcartra.

A DAUGHTER OF KING AAGGIE MEAD out of a 16 lb. daughter of a 33 lb. sire, second dam out of a yearly record granddaughter of Sir Clyde.

A 25 POUND COW with 476.4 lbs. butter in 177 days, out of a 22 lb. full sister to the twice 34 lb. cow Gerben Abbekerk Maid, sells heavy with calf to Sir Aaggie Mead, son of the 1,215 official yearly record cow Aralia De Kol Mead.

A HALF SISTER TO THE 30,000 POUND 4 YEAR OLD, Cascade Fleeta Johanna, with 415 lbs. butter and 11,506 lbs. milk in 145 days, well along with calf to Sir Pietertje Ormsby Canary, one of the best yearly record sons of Sir Pietertje Ormsby Mercedes.

A DAUGHTER OF A 35 POUND SIRE out of a 20 lb. 2 year old whose dam is a 37 lb. 3 year old daughter of King Hengerveld Aaggie Fayne, third dam a 31 lb. daughter of Gordon Glen Pontiac.

A 17 POUND 2 YEAR OLD DAUGHTER OF PRINCE GELSCHER WALKER that will complete her yearly record before sale. Her dam a 27 lb. granddaughter of Colantha Johanna Lad with 714 lbs. butter from 16,930 lbs. milk in 247 days. Second dam an 811 lb. yearly record daughter of Ignaro De Kol. Sells well along with calf to a 34 lb. son of Sir Aaggie De Kol Acme.

MANY OTHER splendidly bred females with good records and bred to the outstanding bulls mentioned above.

Only a very few bulls will appear in this sale, and they are the sort that should especially interest dairymen.

Tuberculin Testing Under State Law

By Dr. J. P. Iverson

THE pure milk law enacted in 1916 declares that it is unlawful for any one to sell, expose for sale or cause to be sold any milk from cows that have not passed the tuberculin test, until it has been pasteurized by the holding process at a temperature of not less than 140 degrees Fahrenheit for 25 minutes. In other words, the dairyman may have his cows tuberculin tested (removing any reactors), or he must pasteurize the milk as defined by the holding method, but pasteurizing the milk costs him money. Of the two, testing generally is the most economical, provided he is careful about buying cows only from herds in which no reactors or very few have ever been found. Roughly speaking, it costs about 20 cents per 100 pounds of milk to pasteurize, which cost must either be added to the consumer's price or deducted from the dairyman's pay check.

The tuberculin test is made free of all cost to the dairyman, but he is required by law to make a written application to State Department of Agriculture, Division of Animal Industry, Sacramento, after which an inspector will call and do such testing. It may happen that an application is received after the inspector has finished his work in the particular district; thus, it may be six months before the herd is tested, during which time the law permits the milk to be sold. This may not appear to be fair to the public, but it can be remedied only through an effort on the part of the local com-

munity, namely, by passing an ordinance requiring that the test be made at once and arranging to have a local approved veterinarian do the work when the state inspector is not available or by increasing the number of field men.

It occasionally happens that a person who does not believe in the tuberculin test is opposed to having the work done, arguing that the test may be detrimental to the animal. This statement, of course, is absurd, since after testing and retesting hundreds of herds, no such case has ever been found. As a matter of fact, we know that the tuberculin used in absolutely sterile and could not cause an infection any more than so much water. Even if the tuberculin were contaminated the very small amount (about one drop) injected into the skin would not cause any visible effect.

Tests have been made on cows by injecting the same amount of suspension of B. coli and other manurial pollution organisms into the skin as is done with tuberculin, and there was not so much as the slightest swelling after the four day period. It is probably safe to say that tubercle bacilli might actually be injected into the skin and no infection would occur, since animals are not easily infected by such a route.

I am glad to say that there is today practically no opposition to the testing, but, on the contrary, it is being carried on harmoniously and with the fullest cooperation by dairymen; in fact, most cattle owners now look

forward to the test, realizing that it is to their interest to have their herds tested and any reactors removed before the disease has spread to the other animals in the herd.

The reaction to the tuberculin test is known as an anaphylactic one and is not peculiar to this test alone. The phenomenon of the protein shock is used in other ways and is considered highly dependable. If a guinea pig is given a small injection of egg white (diluted), he shows no indication of any illness or change of disposition, but goes on as happy as ever, but three weeks later, if he is given a second injection of the diluted egg white, he shows within a few minutes a peculiar nervousness, scratches his head and body, lies down and rolls, breathes rapidly, and may die within a few minutes. If the guinea pig does not die he is then immune to the egg white protein and other injections will have no further effect. The tuberculin test is the same phenomena, only on a much smaller scale; the body of the tubercular cow is being saturated with the protein of the tubercle bacilli. When a small amount of tuberculin (extracted bodies of tubercle bacilli grown artificially) is injected into the skin, a local anaphylactic reaction occurs—reddening the skin, and infiltration with serum, making a small swelling that varies in size from a pea to a walnut. If larger amounts of tuberculin are injected subcutaneously the cows show general symptoms such as rise in body temperature, lack of appetite, and general depression.

I am sure that no thinking person will underestimate the need of careful supervision of our milk supply. If milk from known tuberculous cows is to be permitted to go on the mar-

ket after pasteurization, then pasteurization must be done carefully or it gives a false sense of security. If milk is to be sold raw, the cattle must be tested regularly and the reactors removed.

The conclusion should not be drawn that every herd of cattle is tuberculous. On the contrary, the results of the past four years testing show that of more than 26,000 herds tested over 20,000 were clean; showing, therefore, that in the remaining approximately 6,000 herds were the tuberculous cattle which had made our general average for the state seven or eight per cent.

It is interesting to note also that by far the largest number of herds free from tuberculosis were those under ten; that is, small herds. This condition undoubtedly can be accounted for by the fact that small groups of animals are always less subject to disease than larger ones. In a dairy of 300 to 500 cattle, which would be considered a large dairy, one tuberculous cow might spread the disease to a hundred or more in a few months. The smaller herds, as a rule, are more stable; that is, not changing hands so often, the herd remaining practically stationary in its make up. Buying cows from unknown sources to add to a clean herd has proven the undoing of many a dairyman.

The following summary shows the results accomplished by this work since the tuberculin testing feature of the law became effective: Herds tested, 24,526; herds of ten animals and less, 20,211; herds of more than ten animals, 4,314; herds of ten animals and less free, 17,457; herds of more than ten animals free, 1,590; cattle tested, 220,323; cattle free, 197,009.

Statistics compiled by the state department of agriculture indicate that our dairy cattle population in California is about 750,000 head, which is many times larger than the population in any of our neighboring states. Our records show during the five years that the tuberculin testing provision of the law has been enforced our inspectors have tested about 250,000 cattle, an average of about 60,000 a year, a feat that is worthy of commendation. All raw milk dairies in the state are now regularly tested, and it is worthy of note that probably no other state in the Union can boast of a similar accomplishment.

CAMPAIGNS INCREASE USE OF MILK IN MANY CITIES

Milk consumption was increased 30 per cent in a recent milk campaign put on in Spokane, Washington, by the state agricultural college and the Spokane farm bureau. The work was supported by almost every civic organization, with the assistance of representatives from the dairy division of the United States department of agriculture.

During the week of the campaign 27,911 children heard talks on the value of milk in the diet of the child, and a large number of these children helped personally in various ways to make the campaign a success. The fifth, sixth, seventh and eighth grades in the city schools made clever milk posters. The primary grades put on a play, "The Milk Fairies," and all the children in the graded schools wrote essays on "Milk is a Perfect Food." A survey made before the campaign showed that milk did not enter into the regular diet of 4,770 children in the Spokane city schools, or 17 per cent of the whole, and that 8,846, or 31.7 per cent, drank tea and coffee regularly.

Milk campaigns by the state agricultural colleges, together with the farm bureaus and other local organizations, in which the United States department of agriculture has cooperated, have been held in many cities during the past 12 months. The increased consumption of milk following these campaigns has varied in the different cities. In Kansas City the increase was 14.7 per cent, in Topeka 25 per cent, in Seattle nine per cent, in Pittsburg 24 per cent, in Detroit ten per cent, in Tacoma, Washington, 30 per cent, in Davenport, Iowa, 15 per cent, and in Clinton, Iowa, 15 per cent. The basis for the computation of these percentage increases is a comparison of the month immediately following the campaign with the corresponding month in the previous year. The amount of butter used in the cities

OLYMPIC DAIRY FEED

The Value Lies in its Digestible Nutriments

GOOD health, good appetite and good digestion are essential to producing and prolonging the productivity of good milkers. Stinting the feed box cheats the milk pail as well as endangers the strength and foreshortens the life of the animal.

OLYMPIC Dairy Feed contains 1,000 pounds to the ton of the four high concentrates, being a duplicate of the mixture made for the Dairymen's League of New York State during the war. It is a scientific blend of Ground Barley, Ground Oats, Linseed Oil Meal, Cotton Seed Meal, Soybean Meal, Corn Feed Meal, Wheat Bran and Corn Gluten Feed.

OLYMPIC Dairy Feed is guaranteed 20% protein and is actually higher. This protein is over 70% digestible. It will bring your herds to the highest practical point of productivity and keep them there with the least tax upon their vitality.

Therefore, when you buy OLYMPIC Dairy Feed, your dealer is selling you results—not merely "stuffing". At the great OLYMPIC Feed Mill and in the field, careful analysis and tests are made to insure those results.

LIS' MFG. COMPANY
Box 716 Clarinda, Iowa

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

after a campaign has increased from 15 to 79 per cent.

In every city a part of the work is to explain to the public how the milk supply is protected against contamination. Other features are the work with the schools and demonstrations in the use of milk by the children. That the work results in improved health on the part of the little ones is clearly brought out by the feeding demonstrations.

ESSENTIALS OF ANIMAL BREEDING

Written in simple language for the person who raises farm animals, a new farmers' bulletin, just issued by the United States department of agriculture, tells the basic facts about heredity and how livestock improvement may be brought about. Under the title "Essentials of Animal Breeding," this publication places before farmers and stockmen information which heretofore has been available chiefly in books, many of them being of technical character.

Topics explained and illustrated by the new bulletin include: Beginnings of life, evolution, Mendel's law, determination of sex, inbreeding, crossbreeding, outcrossing, pure breeding, pedigrees, grading up, and maternal impressions. Certain popular but incorrect ideas about heredity are discussed.

Several series of pictures show how good blood "breeds on" and likewise how inferior parents stamp undesirable characteristics on following generations. The discussions deal with all the principal classes of domestic animals, and a summary of basic principles concludes the bulletin which contains 40 pages. Copies may be obtained free of charge by application to the Division of Publications, United States Department of Agriculture, Washington, D. C.

For experienced breeders and for others who desire more detailed information than that contained in the Farmers' Bulletin, the department is preparing another bulletin entitled "Principles of Livestock Breeding," which goes more deeply into the subject. This literature, prepared in connection with the "Better Sires—Better Stock" campaign, adds to the completeness of the series of government publications pertaining to livestock raising.

COW NEEDS FEED

Grain feeding should always be in proportion to milk production. "The cow in milk, if a Holstein," says C. H. Eckles, chief of the dairy division of the Minnesota College of Agriculture, "should be given about one pound of grain to every four pounds of milk produced. A Guernsey or Jersey needs one pound of feed to three of milk. The dry cow in good condition needs little, if any, grain."

"The cow is a milk machine," says Dr. Eckles, "and feed is the raw material. Like any factory or machine, economical operation is possible only when plenty of raw material is available. Turning a dairy cow loose in a pasture does not insure that she will get sufficient feed to hold up in milk production as she should, especially from now until the time when regular housing and dry feed will be in order."

"Practically every real dairy farmer will have silage available. Don't wait too long before beginning to use it. Within 10 days after silo filling is completed, the silage is ready to use and unless pastures are unusually good it is well to begin feeding it."

"The experienced man knows that it is easy to let cows drop down in milk from poor feed, but very hard to bring them back to the high level again later even if good feed is given. Good management means keeping the conditions and feed right all the time so there will be no drop in milk at any time from lack of feed. The cow that has what silage she will eat will be well cared for so far as roughage is concerned so long as the pasture furnishes fair grass. When the grass begins to fail, bring out the alfalfa and clover."

The dispute as to ownership of the waters of the Sacramento, brought into the courts by suit of the city of Antioch, is practically ended by the rice irrigators maintaining that Antioch's supply comes from the San Joaquin instead of the Sacramento.

UNITED STATES CREAM SEPARATOR

WITH PERFECTED DISC BOWL

World's Record Skimming
Interchangeable Discs
Easy bowl to clean

So easy to clean

Milking done; the separator run finished—what then?

Either a mussy, fussy period of washing up and re-assembling—or a quick, sanitary wash-up that's a matter of moments.

---Depends entirely on how wisely you've selected your separator.

The Perfected Disc Bowl of the United States takes the drudgery out of the clean-up. No chance to get the discs mixed; they're interchangeable. Just slip them on the handy disc transfer—at one stroke—wash in warm water, rinse in boiling water, and the job's done.

The United States is a Separator you can live with in peace.

Stock Profits Are Up To You

Did you ever stop to think that success in animal husbandry is a fifty-fifty proposition—half depends on the stock half on the man? Are you doing your full share in your partnership with your horses, cattle and swine? If not, the loss is all That can't be divided.

To get the most out of your animals whether it's work, milk or meat you must keep them healthy and vigorous. And the easiest way to do this is to use

Pratts Animal Regulator

America's original stock tonic and conditioner. For nearly 50 years this natural health improver has been the stand-by of the most successful live-stock breeders. It adds to the ration elements—lacking in the winter ration—which are so necessary to maintain health, vigor and energy.

Begin the regular use of Pratts Animal Regulator now. See how quickly your stock improves in strength, growth and production. Note how much bigger and stronger the youngsters are. Watch results—then

California was represented at the Jesse Engle Hereford sale in Missouri by John A. Bunting of Mission

San Jose and William Briggs, Dixon, and each secured one of the top lots. Bunting bought the June 1919 bull, Beau Blanchard 105th, to place at the head of his herd. This bull, which was declared to be one of the best young bulls offered in any sale this year, is a son of Beau Blanchard, the noted Engle bull, and is therefore a half brother to Beau Blanchard 76th that was grand champion at the last state fair and at Los Angeles. The dam of Bunting's bull was sired by a son of Disturber and out of a Repeater 9th dam. Mr. Briggs secured the junior yearling heifer, Belle Blanchard 83d, a granddaughter of Beau Blanchard and out of a Beau Blanchard dam. Belle Blanchard 83d was a member of the Engle show herd, and in the hottest competition never stood

below fourth rating, and usually stood second or third. Briggs also selected two heifers and a young bull from the O. G. Lee herd near Kansas City.

Professor Gordon H. True, head of the animal husbandry division at the university farm, who has been judging livestock shows in the Hawaiian Islands, has returned to the mainland and plans to spend the balance of his leave of absence at Madison, Wisconsin. It is expected that Professor True will take up his work at Davis about June 1.

Caledonia Farms, West Sacramento, reports the sale of a September 1919 Shorthorn bull calf to Geo. J. Campbell of Hawaii. The selection was made by Professor Gordon H. True. The calf was sired by Pine Grove King and is out of a dam by King of Palacines, a son of Whitehall King.

C. L. Hughes of the California Breeders Sales and Pedigree Company, reports that the Small and Davenport herd of Holsteins was dispersed at the farm near Fresno for satisfactory

prices. Cows sold from \$250 to \$400. Harry Hill of Riverdale paying top price for a daughter of It. H. E. Spires of Caruthers got a good granddaughter of Pontiac Korndyke for \$350. The sale attracted a number of new buyers, as the following list will disclose: Asa W. Allen, Fresno, who was the heaviest buyer, taking 14 head; J. R. Crawford, Burrell; J. M. Case and H. H. Dingley, Lemoore; G. W. Fink, Raisin City; Quentin Laneni, D. H. Foreney and M. P. Holland, Fresno; D. S. Roberts, Lester Roberts and Lewis J. Hammond, Caruthers; J. C. Rock, Riverside, and W. A. Pryor, Lemoore.

Edward Cebrian, manager of Caledonia Farms, West Sacramento, and W. S. Guilford of Butte City Ranch, Butte City, have left for Chicago to attend the International Livestock Show. Mr. Cebrian plans to attend the Anoka sale of Shorthorns and is particularly interested in that sale for the reason that three of the top young bulls catalogued are by Imp. Caledonia. Mr. Guilford will attend the annual meeting of the American Shropshire Association, of which he is a director.

William V. Mong of Your Duroc Farm at Whittier is developing into a national character through his methods of selling Durocs by mail. When he first wanted to get into the hog business Mr. Mong tried to buy some hogs in the East by mail and his failure to obtain any satisfaction from Eastern breeders as to the size, type or quality of their animals led him to dope out his selling method, which gives the inquirer as full information as though he visited the place and saw the animal. Back of this he gives a written guarantee that the hog is as represented. A late issue of the Duroc Digest had an extended article concerning his scheme and other papers with nation wide circulation have asked about it.

Falfadale Ranch at Perris has decided to disperse its entire herd of excellent Durocs in February and will send into the ring a lot of fine sows and gilts and its senior yearling herd boar, Great Orion Sensation Junior, who was grand champion at Tulare, Riverside and Los Angeles and reserve grand champion at Sacramento. This boar has sired a lot of fine pigs and his get won honors in all the shows.

Romie C. Jacks of Salinas, who bought the Stalder Ranch at Riverside a short time ago, is undecided as yet whether to make it into a breeding place for Herefords or to stock it with dairy cattle. The place would be ideal for either purpose and has been run as a dairy for many years.

H. W. Hanman, now in charge of the Hereford herd maintained by the Sierra Vista Vineyard Company, Minuturn, reports the sale of 40 head of females to A. H. Fredson Jr., Hollister. Included in the sale was a good young bull sired by Frederick Fairfax. Mr. Hanman states that there are now around 300 head of Herefords in the Sierra Vista herd and that it is planned to acquaint the public with the herd. In the past only a few breeders were aware that the herd consisted of so many high class animals.

Maiken Louise, owned by Santa Anita Rancho, has just finished a seven day record of 34.3 pounds of butter from 533 pounds of milk. She is a daughter of Tirania Lyons Butter Boy and out of Mechthilde Louise of Riverside 2d. She was bred by Kenneth Abbot, who is now connected with Burr Farm, Los Angeles. Anokla Gelsche Pontiac Walker, a daughter of Prince Gelsche Walker, has finished a record of 105 pounds of butter in 30 days as a junior three year old. Her best seven days netted 26.43 pounds of butter from 512.7 pounds of milk.

J. G. Throckmorton, Sebastopol, announces Saturday, December 4, as the day on which he will disperse his good herd of Berkshires. He will sell his fruit ranch and equipment at auction the same day. Mr. Throckmorton recently sold one of his show barrows that stood third at Sacramento to the Western Packing Co., San Francisco, for 20 cents per pound.

67 FEMALES---3 BULLS

Sales Pavilion
Tulare, Cal.Thursday
December 2^{AT}
10 A.M.

This offering includes a large number of young cows and heifers of more than ordinary merit, and made doubly attractive by the services of the great sires which they carry, these bulls including both short and long time record breeding. In the list will be found:

A SPLENDID COW that has just completed a yearly record of 745 lbs. butter from 17,087 lbs. milk. She sells heavy with calf to a 32 lb. son of King Mead of Riverside.

A 24 POUND daughter of Colantha Sir Pontiac Aaggie that has just finished a yearly record of 653.2 lbs. butter. Due to calve on December 7 to a 32 lb. son of King Mead of Riverside.

A DAUGHTER of a 646 lb. yearly record 2 year old. Dam now on test again and making nice record as a 3 year old.

A 3 YEAR OLD that has just completed a yearly record of 640.6 lbs. butter. She sells heavy with calf to a 32 lb. son of King Mead of Riverside.

A 21 POUND granddaughter of King of the Pontiacs, now fresh.

A 19 POUND 3 YEAR OLD, bred to a 32 lb. son of King Mead of Riverside.

A DAUGHTER OF KING KORNDYKE SADIE VALE, out of a 23 lb. 4 year old granddaughter of Pontiac Korndyke.

FOUR YOUNG COWS bred to a 31 lb. son of Sir Veeman Korndyke Pontiac, whose first daughters to freshen are making splendid records.

A 26 POUND daughter of a 28 pound cow, bred to Prince Gelsche Walker Alcartra, who is by Prince Gelsche Walker and out of a half sister to Tilly Alcartra that made 796.16 lbs. butter from 19,043.5 lbs. milk in one year.

TWO DAUGHTERS of Prince Gelsche Walker Alcartra out of well bred dams.

A DAUGHTER of Creamcup Colantha Pontiac Burke, heavy with calf to Sir Aaggie De Kol Acme 2nd, five of whose seven nearest dams average 1,153 lbs. butter in one year.

A DAUGHTER of the 35 lb. sire Segis Pontiac Abbekerk.

A DAUGHTER of Segis Pontiac Crane De Kol, heavy, with calf to Segis Pontiac Abbekerk.

A SHOW HEIFER, sired by a proven son of Segis Pontiac De Kol Burke.

A 2 YEAR OLD daughter of Sir Aaggie De Kol Acme, now on yearly test and bred to the 34 lb. bull Sir Aaggie Hiske Walker.

A GRANDDAUGHTER of an 811 lb. yearly record cow bred to Palo Humphrey Meka, son of the 1,326 lb. yearly record cow Laurameka.

AN 18 POUND 3 YEAR OLD bred to Palo Humphrey Meka. A 2 YEAR OLD with 519.3 lbs. butter in 305 days, her dam a 23 lb. 2 year old.

TWO GRANDDAUGHTERS of King Korndyke Sadie Vale, bred to a 31 lb. grandson of Pontiac Clothilde De Kol 2nd.

A DAUGHTER of a cow that made 1,093.04 lbs. butter from 27,179 lbs. milk in one year.

A GRANDDAUGHTER of King Segis Pontiac Count, out of a 21 lb. dam and heavy with calf to a 36 lb. son of the three times grand champion King Segis Alcartra Prilly.

A 21 POUND COW that has milked over 100 lbs. per day many different times.

A 2 YEAR OLD daughter of the above cow, with 18.49 lbs. butter in 7 days at 2 years 3 months. She is by a son of King Segis Pontiac Count and sells heavy with calf to a 36 lb. son of King Segis Alcartra Prilly.

ANOTHER DAUGHTER of the same cow, sired by a son of King Walker and due to freshen shortly after sale to a son of King Segis Pontiac Count.

A HEIFER sired by a 950 lb. yearly record grandson of Aralia De Kol. Will be fresh with first calf before sale.

MANY OTHER WELL BRED FEMALES, by great sires, out of good dams, and bred to some of California's best bulls.

Only Three Bulls in the Offering

A son of the 41 lb. \$5,000 bull King Abbekerk Johanna Segis, out of a 29.42 lb. daughter of Spring Farm King Pontiac 6th. The dam and sire's dam average 35.21 lbs. butter in 7 days. Here is a herd header.

A son of Creamcup Fidessa Cornucopia Lad whose dam made 897 lbs. butter from over 22,750 lbs. milk in one year. The dam of this youngster is now on yearly test and making a good record.

A son of the 35 lb. bull Segis Pontiac Abbekerk, out of an A. R. O. granddaughter of King Pontiac Ruby Burke.

READY for Market

with firm, solid, healthy weight — and ready sooner, because of more lusty growth — when the growing pig is fed

Health for the Sow and for the Pigs—

Feed LACTEIN to the sow — and start the foundation of healthy, husky, free-from-disease pigs. LACTEIN so thoroughly cleanses the sow's system, and furnishes the means of perfect digestion of all food. In this way, the sow receives the full benefit from all food—LACTEIN also supplies the element that prevents pig eating. Free the sow from all disease and the pigs will be most healthy. LACTEIN also enables the sow to produce more milk for the pigs. Weanling pigs should be put on LACTEIN.

Your dealer can supply LACTEIN—and you'll find it a most profitable investment in your hog raising operations. Start today with the use of this processed condensed buttermilk.

Betsy Lamb Prilly

WESTLAWN FARMS

Owned by H. E. Vogel

FRESNO

CALIFORNIA

Mr. H. E. Vogel is making an offering in this sale of which any breeder might well be proud, and the opportunity presented for purchase of high class individuals is one which should command widespread attention.

The entire milking herd at Westlawn Farms will be dispersed in this sale, and a number of high class bred helpers and a limited number of good bulls will complete the sale list.

THE OFFERING OF FEMALES INCLUDES:

BETSY LAMB PRILLY, 35.03 lbs. butter in 7 days from 743.3 lbs. milk. She also made over 31 lbs. butter in 7 days as a 4 year old and was Grand Champion cow at San Francisco in 1919. She is due to calve in January to King Aralia Mead, an 1,161 lb. son of King Mead of Riverside.

A DAUGHTER OF KING MEAD OF RIVERSIDE, out of a daughter of Ignaro De Kol that made 762.73 lbs. butter from 18,424.6 lbs. milk in one year.

A 22 POUND GRANDDAUGHTER OF ARLAIA DE KOL with 717 lbs. butter in one year as a 3 year old, her dam a 954 lb. daughter of the 1,085 lb. former world's record milk cow Riverside Sadie De Kol Burke. Her three nearest dams average 1,061 lbs. butter in one year.

A 21 POUND DAUGHTER OF PRINCE GELSCHER WALKER, out of De Kol of Valley Mead 3d, 845.11 lbs. butter in one year.

A YEARLING DAUGHTER OF THE ABOVE COW sired by Sir Aaggie De Kol Mead, son of Sir Aaggie De Kol Acme and Miss Valley Mead De Kol Walker. HERE IS A REAL STAR!

A DAUGHTER OF COLANTHA ALCARTRA FAYNE, 33 lb. grandson of Colantha Johanna Lad, with 25.68 lbs. butter in 7 days as a junior 3 year old.

A 28.36 POUND DAUGHTER of Dutchland Hengerveld Sir Glad, in calf to a son of Betsy Lamb Prilly.

A GRANDDAUGHTER OF KING OF THE PONTIACS, with 21.38 lbs. butter in 7 days as a senior 4 year old. Sells heavy with calf to King Aralia Mead.

A 17 POUND 2 YEAR OLD daughter of King Morco Alcartra, bred to King Aralia Mead.

A 24 POUND SENIOR 3 YEAR OLD granddaughter of Juliana King of Riverside, now on yearly test with 191.47 lbs. butter to her credit in 60 days.

A 24 POUND GRANDDAUGHTER of Juliana King of Riverside, now on yearly test, and well along with calf to King Aralia Mead.

A 22 POUND COW due in December to a son of Betsy Lamb Prilly.

A 21.73 POUND JUNIOR 4 YEAR OLD daughter of the 30 lb. bull Admiral Burke.

A 15.87 POUND 2 YEAR OLD daughter of above cow, well along with calf to a son of Betsy Lamb Prilly.

A 24.23 POUND GRANDDAUGHTER OF JULIANA KING OF RIVERSIDE, now on yearly test, and well along with calf to a son of Betsy Lamb Prilly.

A 23 POUND COW, heavy with calf to King Aralia Mead.

A GREAT COW with a record of 25.11 lbs. butter in 7 days as a senior 2 year old. Will be fresh at sale time.

A 22 POUND COW out of a half sister to Juliana De Kol, and bred to a son of Betsy Lamb Prilly.

AN 18.29 POUND 2 YEAR OLD, heavy with calf to a son of Betsy Lamb Prilly.

A 17.40 POUND 2 YEAR OLD, heavy with calf to a son of Betsy Lamb Prilly.

A LARGE NUMBER OF OTHER COWS AND HEIFERS with good records, out of well bred, high record dams, and bred to one or the other of the richly bred Westlawn Farms herd sires.

A Limited Number of Young Bulls

KING PRILLY MEAD, out of the great producer and show cow Betsy Lamb Prilly, 35.03 lbs. butter from 743.3 lbs. milk in 7 days, and sired by King Aralia Mead, an 1,161 lb. son of King Mead of Riverside. Here is a real herd bull for some breeder.

A SON OF A 25.68 POUND 3 YEAR OLD, sired by a son of Betsy Lamb Prilly.

A SON OF KING ARLAIA MEAD out of a 24 lb. granddaughter of Juliana King of Riverside now on yearly test.

TWO OTHER WELL BRED YOUNG BULLS, both out of dams with good records.

This is positively one of the best offerings ever made in California. The blood lines of the herd are popular, the records substantial, and we believe that no sale in the west has ever presented cattle of better type throughout.

Every animal positively guaranteed to be a breeder; every animal tuberculin tested and sold subject to retest by the buyer.

B. W. Shaper, Mgr.

COLTON, CAL.

They Require Shorthorn Beef

Do you know that there is an extensive trade that requires Shorthorn beef in preference to any other? If not, you will find upon a study of the situation at the several markets that such is the case.

There is a quality in Shorthorn beef that experienced tradesmen recognize and demand.

The extra weight of the Shorthorn combined with this quality gives the grower a double advantage.

It pays to grow Shorthorn beef.

TAKE GOOD CARE OF THE UDDER

In a considerable number of cows the udder is the part of the body involved in bringing in satisfactory financial returns to the owner.

The size and condition of this organ is of extreme importance in this connection. Unlike her early ancestors the udder of the ordinary cow today considerably exceeds its projecting boundaries and consequently is much more liable to mechanical injuries and subsequent invasion of disease producing organisms.

A practical dairyman should devote as much attention to the care of the udder as a mechanic would to a delicate and complex piece of valuable machinery.

To do this we must understand to a considerable degree the nature of the factors that are apt to do harm. The more we study and observe the various causes that are harmful to the udder the more we are convinced that the introduction of bacteria into the tissues of this organ are the most serious source of mischief. It is known that there are many bacteria capable of producing abnormal conditions of the udder, hence it is not necessary at this time to discuss each organism separately.

Since we know that bacteria are the cause of serious udder diseases, the routes of their entrance to the tissues must be understood in order to take the proper precautions to prevent their causing any injury.

These various harmful bacteria may gain entrance to the udder by one of three definite routes: through mechanical injuries; through the introduction of bacteria; via the circulating blood.

With regard to mechanical injuries no inconsiderable number of these accidents may be traced to injudicious handling of milk tubes, barbed wire fences, loose pieces of wire lying around, and pieces of brush and jagged ends of lumber or other sharp material permitted to accumulate in places to which the cow has access. When milk cows are confined in inclosures they should have sufficient room to guard against the udders of reclining animals being stepped on by those moving about.

In milking the udder the hands of the milker or mechanical appliances to the teat should be scrupulously clean.

The last drop of milk should be drawn when milking for two reasons, one being that the last milk drawn is the richest, and the other so that there is no milk remaining on the end of the teat and in the canal in which bacteria may propagate. Stripping by means of the thumb and finger is bad practice because of the danger of injury to the mucous lining of the teat canal and the possible entry of infection into the injured tissue.

Infection via the circulating blood has its source in other areas of infection within the body. The most notable infection of this type is tuberculosis. It is always possible for tuberculosis germs anywhere in an infected animal to find their way into the blood stream and invade the udder.—S. O'T.

DURABLE IMMUNITY FROM CHOLERA ACQUIRED SLOWLY

A longer period is required to develop a permanent immunity in vaccinated hogs than is commonly supposed. The most potent anti-hog cholera serum that can be made cannot of itself confer a permanent immunity. Serum alone confers an immunity of a passive or temporary character, the duration being variable. The use of the "serum alone" is, therefore, applicable only to short feeding periods unless the herd is revaccinated or a thorough disinfection of the premises is made, says Dr. J. W. Connaway of the Missouri college of agriculture. Therefore when a herd is in constant danger of exposure to hog cholera infection it is preferable to confer a permanent immunity; but this cannot be secured except by subjecting the animal to the disease producing activities of the virus.

It is well known that the hog which recovers from a natural attack of hog cholera becomes, as a rule, perma-

nently immune. Likewise, that the "double treated" or "serum virus" inoculated hog gains a permanent immunity if the virus is a living and vigorously active virus. The virus, however, in the vaccinated hog, as well as in a natural attack of cholera, acts in a harmful way on the cells of the body; and the cells for self protection must react to the attacks of the virus and produce specific "antibodies," or protective substances, to counteract the harmful action of the virus. A veritable combat ensues when hog cholera infection enters the system of a hog, and this combat terminates either in the death of the hog or in an immunity more or less permanent. The vaccinated hog, however, has this advantage over the hog which has become infected with virus from natural exposure—a liberal dose of potent anti-hog cholera serum is injected simultaneously with the virus and this constitutes a supply of "reserve ammunition" which the vaccinated hog draws upon for protection while it is strengthening its cellular defenses and elaborating its own protective serum. If, however, the vaccinated herd is not properly handled and properly fed, the virus may overcome the protective guards in spite of the reserve ammunition with which the body was reinforced, and some of the hogs may succumb to acute cholera of the septicemic type, or may linger along with a chronic type of the disease and finally die from the pneumonic complications or from chronic inflammation of the intestines.

Experiments which have been made at the Missouri agricultural experiment station show that the virus remains virulent in the "double treated" hogs for a considerable time after vaccination, even in vaccinated hogs which are given good care and do not show outwardly any symptoms of illness. It was found that (for a period of more than a week) blood which was drawn daily from the tails of "double treated" hogs was almost as virulent as blood drawn from a pig showing well marked symptoms of cholera; moreover, the blood drawn from some of the double-treated hogs even as long as 23 days after vaccination was still sufficiently virulent to cause death when inoculated into a healthy susceptible hog.

It is thus shown that the process of acquiring immunity and overcoming the disease germs in the body is evidently a slow process, and proper care should be given the vaccinated herd for three weeks or more to avoid the development of acute or chronic cases of cholera from the vaccination. Rough handling during this period overfeeding after a fatiguing railroad haul or a long drive may so lower the resistance of some of the animals as to permit the cholera virus with which they have been vaccinated to gain the upper hand and cause death from a true attack of cholera.

CORRESPONDENCE COURSE ON MILK GOATS

To aid in the upbuilding of the milk goat industry the college of agriculture of the state university is now offering a correspondence course of milk goat raising. Circular number 113 may be had by writing to Division of Agricultural Education, University of California, Berkeley.

Book Review

PRICE OF MILK

"The Price of Milk," by Clyde L. King, Ph. D., University of Pennsylvania, published by the John C. Winston Co., New York, at \$2.00.

Of this book the publishers say "Milk is the essential element in the diet of civilized peoples. There is no substitute for milk. The average daily consumption of milk in America is below the minimum considered necessary to maintain health. As a producer, distributor or consumer you are vitally interested in milk and the price of milk."

Herbert Hoover comments: "There is no part of our national food supply the development of which is so essential for national health and in which the commercial factors are of so complex and difficult an order. This advance to better appreciation and wider outlook of the difficulties of the producer and the necessity for better of

ization in distribution is a very distinct contribution of public service."

The book is divided into three chapters touching upon public interest in the price of milk, forces that fix the price, manufactured milk products, cost of production, should dairymen organize for collective bargaining, cost of distribution, sanitary requirements, and distribution costs be lowered, food value of wholesome milk, cooperation and price, and fair price policies. The author is a member of the faculty of the Wharton School of Commerce and Finance, University of Pennsylvania, and was formerly chairman of the governors' tri-state milk commission. At first look it might appear that the dairymen, the real producers of the food, might find occasion to distrust the motives of the author. But answering the question, "Should dairymen organize?" the author refers to various needs for organization and the best rendered by the farmers themselves to the farmers themselves through their own representatives. Thus and thus only are the producers' interests fully protected. The purpose of the anti-trust statutes is to assure a fair price to the consumer and producer and dealer by keeping open the avenues of trade. The spirit of our institutions favors competition. The essence of competition is the free bargain between a willing seller and a willing buyer. The seller is not a willing seller in any economic sense of the word unless his power to sell is equal to the power of the buyer to buy. This is possible as to milk under present milk market conditions only when the producers are organized. The same economic forces that our lawmakers and courts recognized in collective bargaining for laborers are for legalized collective bargaining for dairymen."

LIVESTOCK AT DELHI

The settlers in the state land settlement at Delhi are almost to a man choosing diversified farming. Thirty votes were recently cast in favor of going into the dairy business, while those who would not enter the dairy business numbered only eight. Thirty-five voted in favor of having only one dairy breed in the colony, while two voted adversely to this proposition. Twenty-seven favored the Holstein, eight the Jersey and one the Guernsey breed. However, in the matter of the family cow the vote stood nine Holstein, two Guernsey, 18 Jersey. In dogs, the vote stood: Duroc 27, Pomeranian 4, Berkshire 1. Answering the question: "Do you agree that wherever possible all cattle purchased shall be purchased subject to tuberculin test?"—"Yes" 36, which was unanimous. All voluntarily agreed to the annual or semi-annual test.

SHEEP SCAB

Sheep scab is a contagious skin disease caused by a mite, and can readily be distinguished from conditions caused by other parasites such as ticks and lice. If the annoyance is caused by ticks or lice an examination of the animal will reveal them. On the other hand, if scab is present you will find that the disease spreads rapidly, causing loss by decrease in wool production, weight production and a general unthriftiness of the animal affected. An examination of the denuded areas on the body as a rule will reveal the mites. Death often results from the more advanced stages of the disease.

When animals are found to be affected in this manner dipping is resorted to as the most effective measure of eradication. All sheep infested and exposed to scab are dipped in a medicated solution which kills the mites. A cure is usually effected after two dippings, when administered from ten days to two weeks apart.

Veterinary

Feed Proportions—Depraved Appetite

Can you give me proportion of bran, beet pulp and coconut meal to feed milk cow? In connection with same am now feeding bean straw and cottonseed, the latter noon and night. My cow seems to have a craving for old pieces of wood. Is there something lacking in feed? She has access to

salt at all times.—Subscriber, Redondo.

If you desire to feed only the feeds you have mentioned above, would say that three parts of beet pulp and one part each of bran and coconut meal would about meet the requirements. The amount of this to be fed would depend upon the production of the cows. Probably five pounds per day of this mixture would be about right for the average producer. I would, however, suggest that barley, either ground or rolled, be added, as with the ration mentioned there is nothing which would keep up the bodily strength of the animals. I would suggest, therefore, that your mixture consist of four parts beet pulp, two parts barley, one part each of bran and coconut meal. This could be fed in about the same proportion as above, making about five or six pounds per day per animal. The chewing of old pieces of wood may be a habit. Usually such practice is found where there is lack of salt, but becomes a habit after plenty of salt is available. If the bodily strength of the animal is kept up, as I believe the above mentioned ration will do, I do not believe you will experience any difficulty in the actions of the animal.—G. E. G.

Leaking Milk

Can you give me a remedy for the leaking of milk from cow toward milking time in the afternoon?—Subscriber, Arcata.

It is often quite difficult to stop the leaking of milk from a cow when once the leak has started. This occurs sometimes when cows are fresh and their udders are distended. One of the best things to do, perhaps, would be to milk the cow three times a day in order to relieve the tension on the udder. This would no doubt stop the leaking. This practice could be followed until the production of the cow was reduced somewhat, when two milkings a day would no doubt be sufficient. Sometimes small plugs are inserted in the teat as soon as the milking is over, which helps to hold the milk in the udder until the next milking time. This, however, is not a practice to be recommended, as infection of the udder from the practice is often experienced and may easily occur. The insertion of a plug also is not a cure, as the muscles of the teat are inclined to be more distended than ever, so that if the plug were removed there would be a greater tendency than ever for milk to leak from the teat.—G. E. G.

Horse Lame

Have a horse lame in front feet. Hoof is contracted, frog of foot diseased and smells badly. Please advise me what treatment to give.—Subscriber, Kingsburg.

The troubles you mention with your horse's feet are no doubt two distinct ones, although the disease of the frog may be superinduced by the contraction. The contracted hoof may be caused by rather dry conditions following conditions in which the hoof has been moist, although some horses are rather disposed to have contracted feet on which the above would not hold true. The disease of the frog is probably thrush. I would suggest, therefore, that you poultice the feet with boiled turnips or linseed meal after first cleaning the feet out well. The portions of the foot around the frog should then be cleaned well and packed with powdered calomel. The poultice of turnips or linseed meal will relieve the soreness and soften up the hoof somewhat, which will benefit the contracted part. It will also relieve the soreness of the frog. If the hoof is badly diseased it is well to pack fresh every day, while if it is not in very bad shape the pack may stay in two or three days. It is desirable to bandage the foot up after putting in the pack of calomel in order to keep out dirt and keep the calomel in. The stall in which the animal is kept should be kept clean and dry, as a damp and dirty stall may often cause the above mentioned trouble. Cleanliness is desirable in all cases.—G. E. G.

The ACME Cutter

Combined Silo Filler, Hay Chopper and Alfalfa Meal Machine

Alfalfa Meal attachment can be fitted to all sizes.

Chopped Hay, with careful handling, will keep five cows, while the same weight of loose or bulk hay will only keep four. Waste is eliminated by chopping your hay.

Men who dairy on a business basis find that chopped feed is the surest way to utilize to the fullest extent the feed value of the entire hay crop.

The durable steel framed Acme will earn its cost every season chopping hay and at the same time provide you with a Silo Filler of superior cutting ability and an Alfalfa Meal Machine.

Poultry Queries

Conducted by J. A. Koethen

Aspergillosis

I have lately lost a White Leghorn hen in good condition. She seemed to slowly choke to death. She lived a week or two after I first noticed her choking and seemed perfectly well, only her comb and head turned a very dark red. I thought she had something stuck in her throat but today another hen is acting the same way. I can see nothing down her throat nor feel anything from the outside. Please let me know if this is a disease or if it is something they are getting that chokes them.—Subscriber, Millville.

Your hens are evidently suffering from aspergillosis, the diseases caused by the growth of mold spores in the bronchial tubes. There is nothing to be done but to clean up thoroughly and make sure that all their feed and scratching litter is perfectly clean and sweet. It may be that you are using corn that has been heated or ground grain that has been wet and become slightly moldy. Once the spores have taken hold of the respiratory organs there is no cure for the affected birds, but you can keep others from getting the disease by removing the cause.

CATTLE

For Sale by Owner—35 head first class Dairy Cows, sixty tons of Alfalfa on hand. Will turn over lease for barn and all equipment, including small dwelling house if desired. For full particulars write E. W. Pitman, R. D. 1, Whittier, California.

The Ideal Fertilizer For California Soil

COTTONSEED MEAL is a particularly valuable fertilizer for use on California soils. Its nitrogen content is far more readily transformed into nitrate than higher nitrogenous fertilizers and the fat and moisture content is extremely low.

Large quantities have been used yearly in the Southern States with highly gratifying results. And now, with the rapid development of cotton culture in California, Cottonseed Meal becomes readily available to you at prices which make it the cheapest of high-grade fertilizers.

Average Analysis of Cottonseed Meal:

Nitrogen6	per cent to 6½	per cent
Phosphoric Acid3	per cent to 4	per cent
Potash2	per cent to 2½	per cent
Moisture7	per cent to 8	per cent
Fat6	per cent to 7	per cent

Cottonseed Meal is clean, easily handled, and will not deteriorate. Packed in 100-pound bags.

Write for sample and prices.

Thousands of Happy Housewives in WESTERN CANADA

are helping their husbands to prosper—are glad they encouraged them to go where they could make a home of their own—save paying rent and reduce cost of living—where they could reach prosperity and independence by **buying on easy terms.**

Fertile Land at \$15 to \$30 an Acre

—land similar to that which through many years has yielded from 20 to 45 bushels of wheat to the acre. Hundreds of farmers in Western Canada have raised crops in a single season worth more than the whole cost of their land. With such crops come prosperity, independence, good homes, and all the comforts and conveniences which make for happy living.

Farm Gardens—Poultry—Dairying

are sources of income second only to grain growing and stock raising. Good climate, good neighbors, churches, schools, rural telephone, etc., give you the opportunities of a new land with the conveniences of old settled districts.

For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, and Alberta, reduced railway rates, etc., write Department of Immigration, Ottawa, Can., or

Household Department

TWO YEARS AFTER

Through the crowded streets where the
arc lights burn,
Or perhaps apart from the tolling band,
Once in a while old dreams return
Of another life in another land;
Old dreams of bugles and marching men
Where a sergeant growls "Fall In" again.

The world drifts by as I watch once
more
The doughboys slog through an old
French town,
With its shattered walls that are red
with gore,
Through its muddy streets as the rain
beats down;
Their grim young faces—rifle and pack—
Hiking on to the next attack.

I see them now as the chow lines form,
Pal and buddy and fighting mate,
Ready again for the next day's storm
From the Hun barrage where the big
guns wait;
Where the muffled roar through the
flaming night
Has sent them word of the next day's
fight.

Through St. Mihiel and the Argonne
drifts,
Waiting word for the next advance,
As the mist rolls up and the gray fog
lifts
I can see them now in the woods of
France,
Knee-deep still in the muck and mire,
Working their way through the tangled
wire.

Ghosts in khaki—they linger still
As each drifts by with the old platoon,
Holding a dugout on some hill
Where only machine gun bullets croon
In the last big drive through the maw of
hell
That took Sedan as the curtain fell.

There's a long trail that is winding back
Through the battered towns with their
mud and rain,
Where the world has forgotten both man
and pack
In the older struggle for gold and gain;
The world has forgotten—but now and
then
We dream that the bugle has blown
again.

Is it only a dream when we hear once
more
The caissons rumble across the hills?
When the howitzers bark with their
ancient roar
In the life that carried a thousand thrills?
Only a dream for the fallen mate
Who sleeps where the wooden crosses
wait!—Grantland Rice in The Amer-
ican Legion Weekly.

HOUSEHOLD QUERIES

Ripe Olives

Will you please send me a recipe for pickling ripe olives. My olives are ripe and I have failed to find a recipe telling me how to handle them.—Subscriber, East Bakersfield.

Here are directions given by Cruess in his new book, "Home and Farm Food Preservation": Use stoneware or wooden container. Scald thoroughly, prepare lye of 1 pound soda lye per 5 gallons water, sufficient to cover olives in container thoroughly. Stir frequently. Once every hour remove two or three olives and cut in half. When the lye has penetrated through skin and a little way into flesh (which is shown by change of color), pour off lye into another vessel. Sufficient penetration will take place in three or four hours. Now expose olives to air in vessel in which they were treated. Stir twice daily and leave exposed until they are black or dark in color. This will take from one to five days. The exposure is to bring back color lost by lye treatment. Then return used lye to olives and leave till lye has reached the pits. Eight to 12 hours will usually be required. Pour off lye, cover olives with water. Change water twice daily till there is no longer any taste of lye. This will usually require one week. Now make brine of five ounces (five table-spoons) salt to one gallon water. Cover olives with this and heat to boiling. Pack hot in jars or cans. Sterilize one hour at 212 degrees Fahrenheit and seal.

Since the botulism scare the state board of health requires that all olives offered for sale shall be sterilized at 240 degrees Fahrenheit for 40 minutes in container in which sold.

Corning Beef

Recently in the Cultivator in a recipe for curing beef you said that in corning beef, sugar and salt and salt-peter were used, but no proportions were given. Now I would like to know just how to do it.—Subscriber.

Quoting again from Prof. Cruess' book, "Home and Farm Food Preser-

vation," which, by the way, should be on every home bookshelf:

Cool carcass thoroughly. Cut in pieces 5 or 6 inches square. The cheaper cuts, such as plate, rump, cross ribs, brisket, etc., are ordinarily used. Fat beef is better than too lean. Weigh cut meat carefully and allow 8 pounds salt to 100 pounds meat. Sprinkle one-fourth inch layer of salt on bottom of well cleaned and scalded barrel. Pack in as closely as possible the meat in a layer 5 or 6 inches thick then a layer of salt, another of meat and so on, leaving room for good layer of salt on top. Let stand overnight, then add for every 100 pounds of meat 4 pounds sugar, 2 ounces baking soda, 4 ounces saltpeter dissolved in gallon tepid water. Three gallons more cold water should be enough to cover this quantity. Weigh down meat with heavy stone on board to hold meat well under brine. In warm weather the brine may become rosy or slimy. If this happens make new brine of 8 pounds salt, 4 pounds sugar, 2 ounces baking soda, 4 ounces saltpeter to 4 gallons water. Pour off old brine and wash meat thoroughly. Add new brine. If the meat is kept a long time the brine should be changed occasionally. The meat is usually ready for use in six weeks.

Sugar Cure for Meat

Please tell me how to sugar cure meat.—Subscriber, Buena Park.

After meat has cooled, cut hams and shoulders. Pack in clean scalded barrel, hams and shoulders on bottom, filling in between and on top with bacon. For each 100 pounds meat weigh 8 pounds salt, 2 pounds brown sugar, 2 ounces saltpeter, dissolved in 4 gallons water. Cover meat with this brine. For summer use it will be safer to boil the brine and allow it to cool before using. Weight meat to keep under brine. Bacon strips should stay in brine 4 to 6 weeks before smoking; hams, 6 to 8. Watch brine to see that it does not become slimy or rosy. If it should, pour off and recover meat with new brine made in same manner. Construction of home smokehouse was given in Cultivators of October 16 and November 13, 1920. When ready to smoke remove from brine, rinse off and allow to drain for several hours. Hang in smokehouse, smoking continuously for 2 or 3 days or 3 or 4 hours each day for about 2 weeks. Use hardwood or spent tan bark for smoke. As soon as meat is sufficiently smoked open doors and windows of smokehouse and allow meat to cool. When thoroughly cool remove and wrap each piece closely in paper. Put wrapped pieces in strong sacks and tie at top. Hang where they are to remain until used. The sacks should be coated with thick paste of lime, water and enough glue to make mixture thick. Do not stack in piles; hang so pieces do not touch. These directions are taken from "Home and Farm Food Preservation," by W. V. Cruess of the state university.

Green Olive Pickles

Can you give me information on pickling the green olives used as a relish, the old fashioned green olive?—Subscriber, Fair Oaks.

Pick olives when full size but hard green. Prepare lye of 3 ounces soda lye per gallon water. Place green olives in this and leave until lye reaches pits, as indicated by cutting sample to pit. This will take about 24 hours. Pour off and discard lye. Cover olives with water. Change this daily until all lye is removed; about 1 week. Prepare brine of 9 ounces salt per gallon water (a little more than ½ pound per gallon). Pack olive in keg or barrel or glass jars. Fill completely with brine and drive bung into keg or barrel or seal the jar. Leave in quiet place until the flavor develops. This will be in about 2 months. The above directions are from Prof. Cruess' "Home and Farm Food Preservation." Present rules of state board of health, as noticed in directions for pickling ripe olives, require that all olives shall be sterilized at 240 degrees Fahrenheit

The Cultivator Patterns

BE SURE TO SEND SIZE

3429. Girls Dress.—Cut in four sizes: 4, 6, 8 and 10 years. A 6 year size will require 3½ yards of 38 inch material. Price 10 cents.

held for 40 minutes if offered for sale. This, of course, would require steam pressure.

Home Made Olive Oil

Please give me, if you can, directions for getting oil out of olives.—Subscriber, Alpaugh.

Prof. W. V. Cruess of the state university gave in the Cultivator of January 4, 1919, directions for extracting oil with small home made press. The article is too long to repeat in this column, but Cultivator containing it has been mailed to inquirer.

HINTS FROM HOUSEKEEPERS

Rhubarb Pie

4 cups rhubarb, 3 cups sugar, 4 eggs, 2 heaping tablespoons flour, butter size of egg. First cut rhubarb in half inch pieces, beat eggs and mix with rhubarb, sift flour and sugar together and mix with rhubarb and eggs. Add butter; pour in pie plate lined with piecrust and cook until rhubarb is done. Bake with two crusts.

Fig Loaf

2 cups white sugar, 1 cup milk, 1 cup nut meats, 1 pound chopped figs (dried), 2 tablespoons butter. Mix sugar, milk and butter and boil until a soft ball is formed when a little of the mixture is dropped in cold water. Add nuts and figs, beat until creamy, knead until stiff and shape in a loaf with the hands; lay on oiled paper. Slice when wanted.—Mrs. W. C. Baker, Oroville.

WALNUT RECIPES

Open Cheese Sandwiches

Cut stale bread in one-fourth inch slices and diamond shape. Work together until smooth equal parts of butter and soft cheese, season with salt and spread on each slice of bread. Garnish with a quarter inch border of finely chopped nuts and a piece of nut meat in the center.

Layer Sandwiches

1 loaf nut bread, 1 loaf white bread, ½ cup raspberry jam, ½ cup chopped ham, ½ cup butter.

Cut nut bread in one-third inch slices, cut white bread also in one-third inch slices, put five slices together, alternating the white bread and the nut bread, with a filling of equal parts raspberry jam, chopped ham and creamed butter. Press under a weight and when ready to serve cut in thin slices.

To make checker board sandwiches places four layer sandwiches on top of one another with filling between alternating the light and dark strips. Press under a weight and when ready to serve cut in thin slices.

Walnut Roulettes

½ cup Diamond Brand walnut meats, 4 tablespoons butter, few grains salt, 8 slices bread.

Cut very fresh bread in as thin slices as possible, using a sharp knife. Cream butter, add Diamond Brand walnuts chopped fine and season to taste with salt. Spread on the bread, remove crusts and roll up into cylinders.

Cinnamon Toast With Walnuts

3 tablespoons butter, 2 tablespoons brown sugar, 1 teaspoon cinnamon, 3 slices bread, 2 tablespoons Diamond Brand walnut meats.

Cream butter and add sugar and cinnamon. Cut stale bread in one-fourth inch slices, remove crusts and cut in three pieces crosswise. Toast on one side, spread untoasted side with butter mixture, and sprinkle with finely chopped Diamond Brand walnut meats. Put in oven until sugar melts and serve at once.

HOME AND FARM FOOD PRESERVATION

It so happens that answers to four queries this week have been taken from "Home and Farm Food Preservation," by W. V. Cruess, assistant professor of food technology in the University of California. This book is published by the Macmillan Company, is thoroughly up to date and practical, as directions given on this page will demonstrate. The book contains directions for canning and drying of

fruits, vegetables and meats, preserving and smoking meats, vinegar and wine making, making of cheese and butter, recipes for fruit syrups, preservation of eggs—in fact, it is everything that its name indicates. It can be secured through this office for \$2.

YOU CAN IF YOU THINK YOU CAN

During the war, out in the West, they were building a great dam. This dam was to hold back the water and deliver it to an hydraulic power plant, needed for the generation of a large quantity of electrical energy for the production of necessary things for the war. The dam was almost finished, when one day, out of one of the trains there was shunted a car of stone, and that car of stone was left lying around the yards, with the dam still unfinished. Everything was complete except the putting in of this last load of stone. The freight car of stone, realizing how badly it was needed, spoke to one of the big engines that happened to be passing that way at the time, which happened to be one of these great freight engines.

"Say, friend, I am badly needed over the mountain to finish a very important job. Will you please haul me over?" And the big engine looked down at the humble little car of stone and said, "Oh, get out of the way. I carry only great big train loads of material. I cannot waste my time with you." And it went on its way.

Pretty soon, one of these massive passenger engines came along, and the car of stone spoke up and said, "My friend, won't you take me up over the mountain? I am badly needed over there." And the big passenger engine looked down in disdain and said, "Why, the idea! I carry only Pullmans. I don't bother with freight cars of stone."

But the car of stone was persistent and asked a big switchyard engine, with the same disappointing result. Finally, the car of stone saw a cheerful little yard engine, rather small in size, which seemed to be going about its work cheerfully and efficiently, throwing a car here, and throwing a car there, chugging along and happy in its work. The car of stone decided to try once more. "My friend, I am badly needed on the other side of the mountain to build a dam and the boys in France need the material that the power is going to produce."

The engine stopped and said to the car of stone, "Well, I do not go over the mountain. I am only supposed to run around here. But, I don't know, I believe I will try. I think I can."

So the car of stone perked up, and the little engine was hitched on. The little engine ran down through the yards, singing its merry little song:

"I-think-I-can; I-think-I-can; I-think-I-can; I-think-I-can."

Pretty soon it struck the hill and slower it puffed, "I-think-I-can; I-think-I-can, I-think-I-can." As it got a little farther up the grade it wheezed, "I-think-I-can; I-think-I-can; I-think-I-can; I-think-I-can."

And then as it took the down grade on the other side, its merry song rang out:

"I-knew-I-could; I-knew-I-could; I-knew-I-could!"—Charles R. Hook, Vice-President American Rolling Mill Company.

THE TREATMENT OF POISON OAK

Vacationists are prone to contract poison oak, and some of the simple methods of treatment are enumerated here for the benefit of persons who may be so unfortunate as to suffer from this uncomfortable irritation.

The extremely volatile oil which is so readily transferred to the skin or clothing of the passerby who brushes against the poison oak plant penetrates the skin very easily and causes the acute irritation. Immediately after exposure to poison oak the individual should wash with soap and warm water, followed by a dusting with talcum powder. If this does not bring relief the application of alcohol or spirits of camphor is advised. The use of greasy ointments or salves should be avoided, as they only aggravate the irritation.

Emerson has said that the most valuable product of a farm is not crops but character, and that men take out of the earth much more than they put into it.

Let's go

GRAIN AND COTTON SEED

BUNYIP, BAYAH and DART IMPERIAL SEED WHEATS

California acclimated Australians; best milling; higher prices for product; yield well; shatter less in wind than other varieties known to us.

MARIOUT

There is large demand for this early maturing, drought resistant barley. Car load just shipped Miller & Lux averaged approximately 130 lbs. per sack. All our reclaimed Mariout, when well-jigged, has approximately each weight.

All our seeds grown on new soils, one irrigation only. All water from deep wells. No Bernuda, Johnson or Morning Glory.

Last call for Beldi Barley, Sonora, Early Baart, and the so-called Diener Hybrid Wickets, but can yet supply less than car load lots. No Tennessee Winter or Four Thousand Barley.

DURANGO and MEBANE COTTON SEED

Fully matured seed from purest strains known to us, grown in selected hand-rogued fields. We operate our own gin, carefully avoiding seed mixing.

All seed orders, whether car load lots or less, booked as received, shipments following consecutively.

Write for prices, stating quantity desired.

DRIED FRUITS
California Associated Raisin Co. prices: Muscats: Package seeded, Sun Maid, 25 pound boxes, 20 1/2 cents a pound.
Loose, 25 pound boxes, one crown, re-cleaned and floated, 20 1/2 cents a pound; two crown, re-cleaned and floated, 23 1/2 cents a pound; three crown, re-cleaned and floated, 24 cents a pound.
Layers, three crown flat pack, 20 pound boxes, \$4.40 box; ten pound boxes, \$2.40; five pound boxes, \$1.30 box.
Cluster, four crown pack, 20 pound boxes, \$4.70; ten pound boxes, \$2.55 box; five pound boxes, \$1.40 box.
Six crown flat pack, 20 pound boxes, \$5.50 box; ten pound boxes, \$2.95 box; five pound boxes, \$1.60.
Sun Maid, 20 15-ounce net cartons to box, \$5.20 box.
Sun Maid, 12 two-pound cartons to box, \$6 box.
Sun Maid, Imperial, four five-pound cartons to box, \$6 box.
Vineyard run, Sun Maid, 100 pound boxes, \$21 box (strapping extra, 19 cents per box).
Thompson Seedless, Sun Maid, re-cleaned, 25 pound boxes, 21 cents pound; 48 16-ounce packages, 21 1/2 cents package.
Sultanas, Sun Maid, re-cleaned, 25 pound boxes, 20 1/2 cents pound.
Figs: Fancy black, 25-lb. boxes, 12 lb.; extra choice black, 25-lb. boxes, 10 lb.; choice black, 25-lb. boxes, 9 lb.; fancy white, 25-lb. boxes, 18 lb.; extra choice white, 25-lb. boxes, 1 lb.
Prunes: 30-40s, 25-lb. boxes, 19 lb.; 40-50s, do, 17 lb.; 50-60s, do, 15 lb.; 60-70s, do, 13 1/2 lb.; 70-80s, do, 11 1/2 lb.; 80-90s, do, 10 lb.; 90-100s, do, 9 1/2 lb.
Apples: Fancy, 50-lb. boxes, 14 lb.; extra choice, do, 10 1/2 lb.; choice, do, 10 lb.
Peaches: Blue ribbon brand, 48 11-oz to case, 10.00 per case; do, 24 2-lb. boxes to case, 11.00 case; extra fancy peaches, 25-lb. boxes, 22 lb.; fancy, do, 20 lb.; extra choice, do, 18 lb.; choice, do, 17 lb.
Apricots: Fancy, 25-lb. boxes, 30 lb.; extra choice, do, 28 lb.; choice, do, 25 lb.; standard, do, 22 lb.
Pears: Fancy, 25-lb. boxes, 20 lb.; extra choice, do, 17 lb.; choice, do, 14 lb.

BEANS
Jobbers prices:
Small white, 5 per lb.; large white, 5. pinks, 6 1/4; Lima, 8; cranberry, 6 1/4; Mexican Gravanzas, 8; Lentils, 12 1/2. Blackeye, 7; Mexican Reds, 6 1/4; Popcorn, 8; California Bayo, 9; split peas, 7; green peas, 4.

Shorts, 56.
Middlings, 65@67.

HAY
Alfalfa Growers of California under date of November 20:
There were 565 tons received in San Francisco the week ending November 20, as against 1,509 tons the week before.
No. 1 Dairy Alfalfa27.00
Standard Dairy25.00
Stock Hay22.00
Under date of November 20, A. W. Scott says:
Receipts of hay past week 565 tons. These light arrivals are the result of stormy weather and the interference with hauling and shipping through the country. One effect of the storm is to create a slight demand through the country for both hay and feeds where stock, particularly dairy stock, must be kept up and fed during the inclement weather. The hay market locally is in exactly the same condition as our general hay markets all over the country, dull and inactive. Even with its advance in price hay as a commodity never increased in value proportionately with the grain in any other produce; that is when comparison is made with the purchasing value of the dollar. With the recent reductions, prices of all kinds of hay are not satisfactory to the producers and they are not inclined to dispose of their hay now at figures which they consider a loss. Purchasers and dealers are buying for immediate necessity only and apparently the future of the market mainly depends on the ability of the producer to hold his hay and of the consumer to hold

off his purchases. The weather of course is a most important factor. Right now reports of the severity of the storm and damages from floods make even guessing a doubtful matter but for the present prices are unchanged and firm. Mill feeds, alfalfa feeds and coco and nut meals have been in somewhat of demand during the last week probably with the requirements of indoor feeding caused by the present and possible storm conditions.
A. W. Scott Co. quotes wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charge of cartage, commission and handling expenses must be added according to conditions):
Per Ton
Wheat hay, fancy.....28.00@29.00
Wheat hay (light 5-wire bales) fair to No. 1.....24.00@27.00
Tame oat hay, fair to choice.....24.00@27.00
Wild oat hay18.00@20.00
Barley hay17.00@20.00
Alfalfa hay22.00@25.00

Citrus Markets
Los Angeles, November 23, 1920.
One car of Arizona Navels was sold in New York auction November 22 but no price is given in dispatches regarding it. However, one car sold on the 18th averaged \$7.20. Valencias are closing the season with exceptionally long prices. Great difference in quality, however, results in prices as low as \$2.00 and others as high as \$12.
Lemon shippers are holding back hoping for improvement of present lifeless conditions. It is impossible to get much better than \$2.00 f. o. b.

Shipments
Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 137 cars; lemons, 269; total, 406. To same date last season: Oranges, 1,572; lemons, 272; total, 1,844. From Central California to date this season: Oranges, 200; lemons, 15; total, 215. To same date last season: Oranges, 128; lemons, 42; total, 170. From Northern California to date this season: Oranges, 22; lemons 1; total, 23. To same date last season: Oranges, 30.

AT THE AUCTIONS
November 18
New York: 7 or., 5 lem. Val. 5.25-12.95, Nav. 7.20, lem. 2.15-2.95.

Engineering and Auto Mechanics
THE MOST THOROUGH AND practical school in all Engineering and Vocational Sciences—offering complete courses in ONE HALF the time usually required by Universities. Elimination of non-essential subjects; intensified courses and individual instruction enables us to effect this saving of time. Well equipped shops, laboratories and field instruments. Courses in: Civil, Electrical, Mechanical and Mining Engineering, and Machine Shop. Actual engineering work done by students. Opportunities to earn board and lodging. NEW TERM BEGINNING Jan. 3rd Address: Polytechnic College of Engineering 13th and Madison Sts., Oakland, Calif.

For small growers there is the Hardie Junior Power Sprayer—a low priced high quality Sprayer—150 gallon capacity, maintains 200 pounds pressure.

The Hardie all-brass bucket pump, the only bucket pump on the market with mechanical agitator, 200 pounds pressure with 35 strokes per minute.

Hardie barrel sprayer—mounted on the side for low height and freedom from upsetting. Pumps out all the liquid. Equipped with agitator.

The Advantages of Simplicity in a Power Sprayer

Spraying Troubles at Spraying Time are Extremely Costly

Sprayer troubles are practically eliminated in Hardie Sprayers because of the simplicity of design and the accessibility of each working part.

Investigation will convince you that adjustments and replacements are called for far less frequently in Hardie Sprayers than in any other kind. Ask any one of the 35,000 Hardie users.

The Hardie Triplex with its underslung truck and its wide track is a Sprayer that can be used on the steepest hillside where it would be impossible to take other machines. The tank is carried so close to the ground that it goes through the orchard without injuring the tree or fruit.

Its big capacity and high pressure enables the user to cut the cost of spraying to the bone.

Hardie Sprayers are sold where ever good fruit is grown. See the Hardie dealer or write us direct.

HARDIE MANUFACTURING COMPANY
For 20 years the foremost, exclusive manufacturers of hand and power sprayers, including the FAMOUS HARDIE ORCHARD GUN
222 NORTH LOS ANGELES STREET, LOS ANGELES, CALIF.
Home Office and Factory, Hudson, Michigan
Branches at: Portland, Ore. Kansas City, Mo. Hagerstown, Md. Brockport, N. Y.

The K Hand Stump Puller

Gives Your Hand 96,000

Pounds of Power

Big stumps! stumps and trees with deep tap roots! any stump that can be pulled with the best inch steel cable! you *alone* can pull with my "K" Hand Power Stump Puller--without digging and without the expense of teams and powder. We guarantee it. We refer you to U.S. Gov. officials. We give highest banking references. If you have stump land, the cheapest way of clearing it is with the

HAND POWER

Stump Puller

Frank Hanco, a one-armed farmer of Bowie, Md., pulling double silver maple 3 ft. 8 in. in diameter at the ground, with deep tap roots. This is an easy pull for the "K" as the cable can be hitched high and the leverage is consequently greater.

How the "K" Pulls Biggest Stumps A Mechanical Wonder

The "K" works on the leverage principle. Made of finest steel—guaranteed of the ordinary lifting jack, except that against breakage. Weighs only 171 lbs.—the power is applied on a cog-wheel in-easily carried or hauled about on its own stand of a standard. 100 lbs. push on the truck wheels. Has two speeds—60 feet lever develops a 48-ton pull on the stump—per foot per minute for hauling in cable all an inch steel cable will hold. One or for small stumps—slow speed for man operates it alone—no teams heavy pulls. Works equally well on hillsides and marshes where horses cannot work.

Owners Praise It

H. Sinclair of the Dept. of the Interior, a U. S. Gov. official, writes: "The stump puller is a wonder." Ernest Thompson Seton, author and naturalist, declares the "K" "a great success."

Hundreds of owners write in, telling of pulling six- and seven-foot stumps, of pulling faster and pulling bigger stumps than by any other machine.

Special Offer We are making a special offer to get a "K" Stump Puller introduced in every neighborhood. Write us today for full information and for free book on Land Clearing and about our Wonderful Drag Saw.

A Bigger and Better College of Agriculture

CALIFORNIA has occasion to be proud of its educational system. This state spends more money on its public schools and, notwithstanding the fact that many Eastern states have educational institutions with longer history, few are more richly endowed or better equipped than those of California. The University of California now has the reputation of being one of the greatest educational institutions in the world. It is claimed that the attendance is larger than that of any on the continent. Californians are proud of this record. Because of this pride and the interest we have in our university it is natural that, like many other of our most cherished things, we are most concerned as to its future and, as has been seen, suggestions for bettering have been made according to best judgment of the writers through the columns of the California Cultivator. This with particular reference to the college of agriculture.

Some of the suggestions have been taken as unduly critical and have brought many replies in defense of the college. The first of these which we quote below is written by a native of India who in completing his education in America has chosen California college of agriculture. On account of the length of his letter, and of others, we have found it necessary to abridge slightly. Mr. Singh writes:

By Lal Singh, U. C. '21

Any person who complains about lack of democratic spirit either in faculty or student body of U. C. must have, I am afraid, either a poor judg-

ment or a wrong conception of democracy. Democratic spirit prevails in every step of college life. The professors even in classroom encourage the students to be very frank and informal in their discussions. Students feel at perfect liberty to go to the instructors at any time in their offices and take as much of their time as they care to take. I know of dozens of occasions where many students because of some difficulties in their courses have kept the professors one to two hours over their usual schedule time, and it is to the credit of the instructors that they cheerfully do it. They are ever ready to help and assist the students in every possible way they can. If this does not show the whole-hearted and unselfish devotion of the professors towards the students then I am miserably at loss to know it.

The charge that self-supporting students are looked down upon is not only gross untruth but even a rebuke to the art of imagination. To be specific I can name dozens of fully self-supporting students who, being awfully hard pressed financially perhaps, have never worn anything except old corduroy pants and blue shirts in the college, but simply because of their high standing in the class they are highly respected by the students everywhere.

One of the critics in your paper has accused the U. C. agricultural college of being too strict in its requirements. I believe he is quite right in it. But this in turn only reflects upon the high standing of the U. C. agricultural college. No college can keep its high

standard without having strict requirements. U. C. agricultural college cannot afford to be a dumping place for unworthy students or for those unwilling to study. It aims at producing men of highest intelligence who should occupy responsible positions. I also have, like many other students, experienced some difficulty in filling some of the strict requirements, but I have not been disheartened. I am determined more than ever to get my degree from this university because I feel that degrees from such well known institutions as this carry more weight than ten degrees from other ordinary colleges. The graduates of this famous college, in addition to practical knowledge, are expected to know and solve the mysteries of the science of agriculture. Persons desiring to get only practical knowledge can very well get it by working on big farms; or U. C. farm, Davis, affords excellent opportunities.

* * *

By M. H. Kimball

My home was in Weiser, Idaho. From that "off-side" position I had an impartial view of three possibilities, the University of Idaho, the University of California, and Oregon Agricultural College. The choice was the University of California, as a result of these three or four considerations:

First, I had to work my way. I felt that a larger city close at hand would offer better opportunities for remunerative occupation outside of college work. There is plenty of work here, and I have so far more than paid my own way. The presence of

the large city has not for me, and has not for any of those who are in earnest, proven an abstraction and an obstacle to good work. On the contrary, the advantages of the city as a source of music, operas and talent of all kinds is only an added field of education.

Second, the democracy of California has a wide reputation, and I wanted to live in that atmosphere. That spirit is certainly prevalent on the campus. No line of demarkation exists between the agricultural students and the students of the rest of the university, or between the self-supporting student and those who are more fortunate in their finances.

Third, I wanted an education with a training, rather than a training by itself. I wanted to come out of college with a foundation that was broader than that which is purely agricultural. If merely a training is desired, I agree that a shorter course is advisable, but who wishes to be a university graduate with no greater horizon than the boundaries of his fields?

As a final consideration, I wanted the college with the highest standing. Entrance requirements are a good indication of graduation requirements, and in that respect California is the most rigid.

I am not attacking the other schools, for, never having been in attendance there, I am merely stating what I know of California from three years' residence, and why I came here in preference to the others.

By Bruno Hahne '21

Judging by the articles of Mr. Royce and his corroborators in the August 28 (Continued on Page 750.)

Almonds: A Bit of History and Cultural Methods

C. TUCKER, manager of the California Almond Growers Exchange, felt it was wise to give better information as to the growing and care of the almond orchard to representatives of the exchange in Eastern market centers so he wrote a series of letters giving information which would be of value to the broker and to the wholesaler. As Mr. Tucker expresses it in Letter No. 1: "We shall tell the complete story of the Blue Diamond almond from grower to consumer."

While these letters were intended to be of interest and to inform the trade and agents handling Blue Diamond almonds and to give the novice his first information as to almond culture, they still have interest for many of us Californians, especially those who are not engaged in almond culture; likewise there are occasional hints of real value to the producer of almonds. The first letter touches upon

Growing a Perfect Almond

California is the only state in the Union in which almonds can be grown in sufficient quantities to be commercially profitable; in addition to this,

there are only certain districts in California where almonds can be grown successfully.

The grower of today must not only be a man of vision, but must be a business man and possess many necessary qualifications to be a success as a grower or rancher. Here in California the term rancher is more generally used than the word farmer, for in the earlier days the principal land holdings were great ranches, comprising many thousands of acres each, but the day of the big ranch is past; smaller farms are more easily cultivated and conform to the more exacting conditions of the labor situation.

Fertile soil is the first requisite in the production of perfect almonds. The almond is a deep rooting tree and draws heavily upon the plant nourishing elements of the soil.

Analyses of almonds, as compared with other commonly grown fruits and nuts, show that the almond leads in the total quantity of mineral matters withdrawn from the soil. For best results almonds require a rich sandy loam soil, well drained, at least ten to 12 feet deep.

The almond is one of the most exacting of fruits as regards its cultivation. Nowhere in the world is land so

highly cultivated as the broad acres of California, whose glorious sunshine, fertile soil, abundance of water, combined with ideal growing conditions, produce the most perfect foods for the human needs. Statisticians have figured that the state of California alone can produce enough foodstuffs to feed the population of the entire United States—small wonder when you think of soil from 25 to 50 feet in depth. Nothing is left to chance in growing Blue Diamond brand almonds. Only the very latest scientific cultural methods are employed in planting almonds that will grade up to the exacting requirements of the celebrated Blue Diamond brand. The area in California is so limited that to find lands that are suitable is quite a problem. This is one reason why there is not a faster increase in the production of almonds. However, there is a constant increase in acreage of almonds being planted. Almonds generally flourish in the valleys or foothill sections. Therefore our slogan, "From the Valleys of California."

After the careful selection of soil, which should be made by soil experts, in a district adapted for the successful growing of almonds, water is the next problem that confronts the

grower. Drainage is very important. The almond root is very particular as to its air and moisture requirements in the soil. It will not endure standing water in the soil for any length of time, especially in the growing season. Exclusion of air by excessive moisture is believed to be one of the most productive causes of "sour sap." If allowed to continue for any length of time such conditions will cause the death of many, or even all, the roots and with them the top. Water for irrigating almonds must always be used with great care, whether it be in summer or winter. All water should be so applied that it will readily spread through the soil and not remain in excessive quantities for any length of time. It is impossible to state any definite amount of rainfall which will, or will not, maintain the trees and enable them to bear regular crops of nuts. It is generally conceded that where the rainfall during the winter averages 16 inches, almonds can be grown without supplementing the water supply by irrigation, if the orchardists exercise reasonable care to conserve the moisture for the use of the trees.

While the almond tree is in many (Continued on Page 727.)

Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

EDITORIALETTES

Watch out or the tax man will get you, for in many of the counties of the state the first Monday of December marks the day when delinquents are charged up with more or less serious penalties. Taxes are high enough this year without any additional penalty.

Speaking of taxes, we are reminded of a remark we recently heard in effect that one-fourth of all the wealth created in this country passes to the tax gatherer. Our total wealth production is around \$40,000,000,000 annually. The federal government alone must raise some four or five billions each 12 months. On top of that come state, county, city and district taxes. Then to many of us come improvement assessments. We cannot help but ask, "How Long?" The answer is simply a grim demand for more and the screws are put on and we pay. It is reported that there are fully as many federal employes in the city of Washington as there were during the war period, and every clerk of every county official has to have a pretty little girl to run his adding machine for him. Gee!

A bit of valuable information as to almonds and cultural methods is started this week on Page 719. This information has been gathered by Manager T. C. Tucker of the Almond

Growers Exchange. It is primarily for the benefit of Eastern trade connections of the producer, but there are so few of us in California growing almonds and thoroughly informed as to their culture that we believe this will prove wonderfully interesting to all and the cultural information instructive to the producer. Almonds are one product of which we put out a quantity insufficient to supply our own people, but the importers were never more busy than they have been this year, and almond growers are ready to unite with other fruit and nut producers to secure a measure of protection.

* * *

Many of the little roadside fruit stands in California offer attractive fresh products at reasonable price and at the same time succeed in securing for the producer more than local markets offer. These benefit both producer and consumer. Too often, however, the roadside fruitstands in the outskirts of our larger cities are under the management of hucksters who have found business dull in driving from house to house and are encroaching on territory which really belongs to the producer. But even then the most unfortunate feature is the fact that the prices charged, usually above those in the fruit stands in the city, succeed in killing the trade of the legitimate producer-dealer. In addition, there is once in a great while a regular producer who is asking exceptionally long prices and is charged with being a profiteer. The Rural New Yorker finds that in New York state this is a common fault with real producers and appeals for building up a bigger and better trade by taking the consumer into consideration. The big thing is to get the autoist to come to the farmer for the goods. Fair dealing will secure this.

* * *

"They say" that the Japanese are showing restiveness all over the state. The restiveness is manifested in engaging passage on Japanese steamers for two or three months in advance, in moving toward the Mexican border and in non-fulfillment of labor contracts and even in forsaking some land leases. The timid are concerned and all are asking why. It may be a good bluff or there may be other reason plain to the Oriental but unfathomable to the Occidental mind. In any case it's another proof that oil and water won't mix.

AMERICAN HOLIDAY

The time was when a Roman holiday was only complete with much spilling of blood of innocent victims. Americans read with a shudder of those gladiatorial days and wonder if it could be possible that the blood of any of those vicious spectators runs in their veins. But have our ideals changed very greatly?

The report of the festivities occurring on almost any of our legal holidays is a chronicle of bloodshed. The automobile races held in Los Angeles on Thanksgiving Day resulted in the death of three young men with promise before them of long and useful lives. They were skilled; they were able to control their swiftly flying machines; they were noted for their cool headedness. But in a moment their lives were destroyed—forefeit to the mad craving for excitement of the tens of thousands whose idea of observance of Thanksgiving Day is to attend a "show." Repeatedly during the few days preceding the races the question was heard: "Whose life will be given as a result of these races?"

It appeals to us that the speed of 100 to 110 miles which has been shown by the automobile has been so fully demonstrated that from a mechanical standpoint there is no further demand for these tests made at such fearful cost. In fact, we do not think that any feature of the mechanics of the automobile is in any way concerned in these races. We simply demand an extra thrill.

A FAIR PRICE

Milk is so essential to the welfare of the race that its production and distribution are guarded as in the case of no other food. Owing to its necessity to every one of us humans its price has been held so close to cost of production—too often below—that hundreds and even thousands of dairy-men are discontinuing the business, yet we discuss still more price control. We have from W. R. Mitchell of Los Angeles a communication in which he refers to this feature of food distribution as follows:

"All of us are consumers, some of us are milk distributors and a few are producers. Juries and arbitration groups are splendid evidences of civilization; then why not adjust our milk selling price by so simple a plan somewhat as follows: Three milk producers chosen by their well organized group; three milk distributors named by their association and six consumers who have no economic interest in production or distribution. Perhaps a more equitable milk selling price could be successfully adjusted. Why not accept such plan?" Simply because the six consumers and three distributors would fix the three little producers so there wouldn't be any producers any more. If folks want milk, the cost of its production must be paid and arbitration groups can't affect it. Resolutions of clubs of consumers are all right, but when it comes to adjustment of prices economic laws must prevail.

SLUGGISH MARKET

The raisin growers seem to be the only California producers whose product is accepted in the market at

a price which will meet the cost of production. The rice growers, with anywhere from 30 to 70 per cent of the season's output destroyed by the recent storms, are able to secure little more than half the actual cost of production. Cotton is hovering around 12 cents, with some sales of low grade at nine cents per pound. Some growers in the Imperial Valley are offering one-half of the cotton in the field to the laborer who will harvest it. In fact, the labor situation is such that many fields of fine quality cotton will not be harvested at all. Potatoes are some better. Onions are weak. Hay and grain is hardly bringing cost of production under modern day wages, with downward tendency for the grain. Nearly all dried and canned fruits show downward tendency. The wool grower is unable to sell at any price. The wool growers of Ohio, recently in session, passed a resolution urging upon the people the adoption of the slogan, "Buy a suit of clothes." We fail to see how such a slogan would get the wool producer anywhere. It is said that a \$75 suit of clothes contains only some six or seven dollars worth of virgin scoured wool, which even then is figured at something like \$1.75 per pound. This is several times over what the grower can secure for his raw product, which would reduce the benefit for him from a suit of clothes to something like 'steen cents. In any case it looks to us like a most roundabout way to benefit the wool grower, but more to benefit the retailer, the manufacturer and the maker of shoddy.

It appeals to us that we are past the slogan stage and are ready for closer cooperation on the part of producers.

THE LARGEST CHERRY TREE

San Jose now claims the lead in the cherry tree contest. The following is from R. Atherton of San Jose:

I read in the Cultivator of November 20 of W. J. McGrath of Watsonville anxious to know who has the largest cherry tree in California. He says he has one that measures eight feet six inches and is 35 years old. As I have one larger, I take this means to let him know about it. I have a cherry tree that measures nine feet six. I don't know the exact age, but am sure it must be at least 35 years old. I would be interested to know if there is anyone who has a larger tree.

Vegetation in Relation to Environment

By Gordon Surr

THE accompanying photographs strikingly show the influence of the origin of a soil upon the character of the vegetation. The photographs are of "Rocky Hill," a couple of miles easterly from Exeter, Tulare County. The rough light colored hill, with boulder like masses, is granite, while the smooth hills nearer the foreground are made up of serpentine rock and other basic igneous rocks. One of the views shows an orange grove in the middle distance, with magnesite workings on the extreme right, the level area being a portion of the great San Joaquin Valley.

It is of particular interest to note that the trees, which are Wislizenus oaks, grow only upon the granite, extending right up to the basic rocks but not upon them. The photo taken at close range shows an area underlain by serpentine rock, in the left and middle foreground, and the oaks, it will be observed, reach the extreme edge of the granite mass, but not beyond.

The decided preference of the oaks for this and for other granitic hills in the region may be due to several things, such as a lighter, looser soil, different moisture conditions, lack of cracks in summer in the granite soil, no grass fires when the trees are young, and the presence of far more potash in the granite than in the basic rocks. Hence where many oaks are seen on distant hills the rocks are, in all probability, not serpentine rocks, which kind of reasoning may be termed long distance geology. Furthermore, reddish and green lichens and mossy growths are common on the outcrops of the basic rocks, but these bright colored growths are not

Showing Relation of Vegetation to Soil

Upper: "Rocky Hill" at contact with serpentine. March 28, 1920. Lower: "Rocky Hill" from south. Wislizenus oaks on the granite but no trees on the serpentine rock adjoining.—Photos by Harold A. Cole.

at all common on the granites here. Nowadays about all the walking many a person gets is from the door of the home to the place where the automobile is kept, and much of interest "among the untrodden ways" is thereby missed, to say nothing of the possibilities of impairment of the physical and mental well being from lack

of exercise and of interests outside the daily business grind.

One of the best ways of judging soils is to note what grows upon them and how the plants thrive. Weeds, after all, are merely plants out of place, and an excellent method of making use of them is to learn all we can from them. Some plants

grow under conditions which would kill others, such as salt grass and certain salt bushes and samphires, which are able to put up with a good deal of salt and alkali. On the other hand, cranberries cannot stand a soil the least bit alkaline. Green algae may be seen growing on the rocks along-side streams of nearly boiling water at Arrowhead Springs, north of San Bernardino, under conditions which would literally cook many plants, and certain pines flourish where oaks would starve to death. Then, in parts of California, prickly pear is abundant on the south sides of the hills, with quite a different vegetation, no cactus, and much better soil in many cases on the north slopes of the same hills. Again, white sage and lupines frequently take the place of greasewood (*Adenostoma*) destroyed by brush fires, while desert regions have their own distinctive flora, adapted in various ways to withstand the fierce conditions. The Torrey pine is known only in a small area on the coast of Southern California and on Santa Rosa Island. Altitude and the corresponding climate are also very important factors and the natural vegetation of a region is separated into more or less sharply defined zones, characteristic of certain elevations above sea level. The famous Calamina violet (*Viola calaminaria*) of Westphalia is an illustration of the effects of soil ingredients, for the flower, which is normally blue, is yellow where the plant is growing on the decomposed outcrops of zinc ore deposits.

Experiments at the Rothamsted station in England, with fertilizers on uncultivated land, show marked differences.

Orange Defies Geographical Lines

By Geo. C. Mansfield

AN orange and olive exposition in Philadelphia would cause the world to marvel. And yet, between the 15th and 20th of this month, at a latitude the same as Philadelphia, California staged an orange and olive exposition which, both from the standpoint of artistry of arrangement and as a commercial demonstration, resulted in widespread commendation from experts, and all of which shows that California is different.

The fair marked the resumption after the war of the Oroville Orange and Olive Expositions, which a few years ago were given annually. The exposition was staged in the magnificent auditorium owned by the city of Oroville and built out over the banks of the beautiful Feather River.

In addition to large commercial displays of oranges and olives, semi-tropical fruits grown in the Oroville district were also extensively featured. The list of these fruits included avocados, including nursery trees and fruits from orchard plantings; guavas, limes and feijoas.

The time chosen was during November, as the orange packing and the olive processing season is at its height at that time in the Oroville district.

As announced in the preliminary publicity its purpose was to make known Northern California to Californians. The exposition demonstrated the truth of the statement of Professor E. J. Wickson in his book, "California Fruits":

A Citrus and Olive Fair as Far North as is Philadelphia

The upper of the pictures shows an exhibit at the citrus fair recently closed at Oroville. A great showing of citrus fruits was made and an even greater one of the world's finest olives. The upper exhibit is principally occupied by a display made by Wyandotte, Butte County, which was first prize winner. The lower engraving shows in the foreground the exhibit of the Stewart Fruit Company, while in the background is an exhibit of Ehmann olives.

"One who seeks to know California well must undertake to master both its horticultural greatness and littleness, and so closely are these associated and so narrow the belts of special adaptations that there are counties which have a range of products nearly as great as the state itself.

"It is hard for the stranger to realize this. It is difficult for him to believe that the terms 'northern' and 'southern' have almost no horticultural significance in themselves; that northern fruits reach perfection under proper conditions in the south and vice versa.

"Latitude, which is a prime factor in geography, is of exceedingly small account as an indication of horticultural adaptation in California. The fact becomes apparent when it is known that the apple and the orange, fruit kings whose kingdoms lie at opposite ends of the temperate zone, so distinct that one may be called semi-frigid and the other semi-tropical, have in California utter disregard for the parallels of latitude, which set metes and bounds upon them in other lands. Impressive as this truth may be, it is not so startling as another fact, viz., that fruits in suitable interior situations ripen earlier at the north than at the south, a complete reversal of the tenets of the geographer."

Interest in the exposition just closed was accentuated by the fact that there are 50,000 acres of land in the foothill district of Oroville where oranges, olives and deciduous fruits thrive, that has been and is being organized into irrigation districts. As the planted area has been limited by the available water, it is predicted that the new development will result in expansion of the citrus as well as other fruit industries of the district.

Agricultural News Notes of the Pacific Coast

Northern California

Sonoma County farm bureau dues have been raised to \$3.00.

Fair Oaks, Sacramento County, high school has a milk goat club.

Sutter County growers have planted 115 acres to peas to supply Eastern cities.

The Colusa rice district reports now in warehouses something over 1,750,000 bags.

The University of California made exhibit of livestock at the Portland Exposition.

California Cattlemen will meet in annual session at San Francisco, December 6-8.

Rice growers are now estimating losses from the recent storm to be at least 30 per cent.

There were 45,000 visitors to the El Dorado national forest during the past camping season.

Dr. Walker of Willows has been re-elected president of the State Federation of Farm Bureaus.

Grape growers of Napa County are making an effort to hold the experiment station work at Oakville.

It is now thought that the rice association will soon have almost entire control of the disposal of the 1920 rice crop.

A cargo of dehydrated eggs recently arrived from China. This is supposed to be for the bakeshops of the Pacific Coast.

Irrigators near Corning, Tehama County, are discussing advisability of organizing under the Wright irrigation law.

Northern California's citrus productive abilities were shown in the Orange and Olive Exposition held at Oroville last week.

Rice growers are taking up a campaign of advertising to inform Californians that rice is grown in California and not exclusively in the Orient.

Chico, Butte County, farm center has called together livestock and grain men and discussed matters of disposing of stock and grain at more remunerative prices.

Farmers of Glenn-Colusa district who are compelled to take old time prices for their products are insisting they must have a pre-war power rate or quit business.

Grain growers are pleased at the success of the farm bureau marketing committee's effort in securing grain elevators and the necessary marketing machinery for next year's grain crop.

Superintendent Kruetzer of the Durham Colony has been investigating pork markets at Portland, and reports that California hogs are discriminated against there because of many shipments of acorn fattened pork not coming up to the standard.

Director Hecke has been making a campaign with pear growers for more satisfactory work another season in the matter of spraying pears. While there has been no danger there has been serious loss because of the ignorance of Eastern inspectors.

Orland farmers have organized their own meat club. Different members will occasionally furnish the beef or other meat animal and the slaughtering and distribution will be in charge of someone of their own membership. It is proving remarkably profitable.

Central California

Kern County has been shipping Navels since November 20.

Fresno County farm bureau recently held a fat hog auction with 200 head.

Now the olive people are suggesting a "Buy a case of olives" campaign.

The new settlers of the Delhi Colony recently organized and made a drive on jackrabbits.

Stanislaus County poultrymen are having a course of lectures on poultry and poultry products.

The Prunedale Grange of Monterey County is conducting an active campaign for new members.

The Kings County farm bureau has approved the articles of incorporation of the state marketing exchange.

Fifteen hundred people attended the annual picnic of the Merced County farm bureau at the fair grounds.

The almond packing plant at Oakdale, Stanislaus County, has finished the season with 293 tons handled.

An effort will be made to keep the Middle Fork road to the Sequoia national forest open during the season.

Officers of the Alfalfa Growers Association have recently been touring alfalfa producing sections and securing new members.

At the Turlock hog auction sale on November 17 111 hogs were sold to one buyer at prices ranging from \$11.25 to \$12.75.

Cotton growers of Kern County last week made auto inspection tour of cotton growing sections of the county under auspices of the county-farm bureau.

Manager Niswander of the Peach Growers says the crop handled this year amounted to 24,000 tons, against 32,000 last season. The fig output will, he estimates, run around 9,000 tons.

Manager Webster of the San Joaquin Valley Milk Producers addressed the Arcola center of the Madera County farm bureau at a recent meeting. His theme was necessity for cooperative marketing.

The State Fruit Growers Convention at Fresno authorized the sending of representatives to a conference of railroad executives in Chicago in January to present the needs of the California fruit grower for better transportation service.

S. V. Christerson of the apple inspection service is after apple pickers who have been careless in packing of damp apples which have a faculty of picking up quantities of dirt and lessening the attractiveness of the pack. The ruling has been made "virtually free from dirt."

Central California Wool Growers Association has been organized. It is to include the sheep growers of the San Joaquin Valley district and will endeavor to secure a fair price for the past season's clip. A meeting was held in Stockton November 27 to discuss ways and means.

Kern, Tulare and Kings Counties farmers met at Visalia recently and invited the farm bureaus of Fresno, Merced and Madera Counties to join in another meeting to be held December 7 at Visalia to discuss and possibly protest the increase in electric power rate asked by the Southern California Edison Company.

Southern California

It is estimated that the 1920 turkey crop of the Imperial Valley will return the raisers thereof more than \$200,000.

The California Growers Association last week distributed \$21,000 to the apricot and peach growers of the Hemet Valley.

Apple growers of Yucaipa Valley, San Bernardino County, report trees making better fall growth than they have ever seen.

The output of cotton for the Peris and Nucvo sections of Riverside County this year will range between 500 and 600 bales.

The International Cotton League of the West will open a "spot cotton" market in Los Angeles, January 1, the first one west of Texas.

Poultrymen of Hemet Valley met the evening of November 15 to perfect plan for cooperative purchasing of supplies in a local way.

The San Dimas Orange Growers Association reports shipment of 659 cars for the past year, with a net return to the growers of \$865,465.31.

More than 50 beet growers of San Luis Obispo County have organized for the cooperative marketing of their crop on a five year contract plan.

O. F. Cook and W. B. Camp, cotton experts with the United States department of agriculture, last week visited all cotton sections of Southern California.

Coachella Valley people are very much in earnest in their efforts to induce the state highway commission to pave the road between Indio and Banning.

The Yucaipa Apple Growers Association is making distribution to growers on the Delicious, Jonathan, King David and early varieties. \$10,000 is being distributed.

The bureau of markets of the United States department of agriculture is working to secure standard sizes of containers for shipping all California fruits and vegetables.

Santa Ana and Anaheim have a scheme on hand for building a joint outfall sewer to the sea, a project that, according to engineers, must be carried out in the near future.

The Los Angeles chamber of commerce has instituted, under the direction of Dr. Ford A. Carpenter, a thermometer testing department for the benefit of orchardists using field thermometers.

Residents of the Peralta section of Orange County are much disturbed over the great amount of "Christmas" berries harvested for Thanksgiving, fearing none will be left for Christmas decoration.

The Riverside County farm bureau will send an attorney to represent it at the hearing held December 12 in San Francisco by the railroad commission to inquire into rates of Southern Sierras Company.

From various parts of the south end of the state come statements that ten sacks an acre of Mariout barley has been obtained as against six sacks an acre of common barley on adjoining check plats, and others report as high as 19 and 15 an acre for the new variety.

The Coast and General

Wisconsin potato growers are generally holding for better market.

Fruit growers of Coxsackie, New York, have incorporated as a packing and marketing association.

Automobile registrations in Oregon during the period, January 1 to September 30, numbered 99,998.

Paisley, Oregon, 50 miles from nearest railway, has just been the scene of a successful county fair.

The Wenatchee Apple Growers Association, Washington, will ship 8,600 carloads of apples this season.

Arizona cotton gins are running to full capacity and handling the crop as fast as labor shortage will permit.

The Iowa Vegetable Growers Association held its annual convention at Council Bluffs, November 17 to 19.

Wisconsin beekeepers are receiving 20 to 25 cents per pound for No. 1 extracted. Retail price is 30 to 35 cents.

The American consul at Alexandria, Egypt, reports the 1920 cotton crop of that country at about 612,000,000 pounds.

The Texas Farm Bureau Federation and the Texas division of the American Cotton Association have been consolidated.

During October, Phoenix, Arizona, started two new school houses, four apartments, eight business buildings and 69 dwellings.

The Washington egg laying contest shows two hens owned by residents of Seattle and Tekoa which laid 213 eggs each in the year.

Jackson County, Oregon, leads the state in pear acreage, having 8,050 growing trees. It is also second in apples, with 5,694 acres.

The pear crop in the Medford, Oregon, district is equal to that of last year, but the apple shipments to date are but one-half as large as those of 1919.

The Western Royal Livestock Show at Spokane, Washington, brought out exhibits from Canada to Southern California. Unusually good weather prevailed during the show.

Apple shippers of Yakima, Washington, say that more apples will be stored this year than ever before. Growers are reluctant to sell at present prices.

Exports from Japan to the United States in 1919 were more than \$200,000,000 above the value of those of 1918. Raw silk sent here in 1919 was valued at \$276,000,000.

Late cotton fields in Arizona are developing in better shape than ever before. Light frosts have touched lower leaves in some low sections, but have been beneficial rather than otherwise.

United States Engineer Gault has completed his report on the irrigation project to furnish water to 900,000 acres in the Imperial and Coachella Valleys and it has been sent to Washington.

Train service on the San Diego and Arizona railway commenced on Thanksgiving Day with two trains each way daily. One goes to Chicago and return, the other plies between San Diego and Calexico.

Copyright 1920, by The Goodyear Tire & Rubber Co.

"The big Goodyear Cord Tires on our two motor trucks are helping us to reduce the high cost of farming. These pneumatics travel anywhere in the fields and, during threshing, enabled us to dispense with eight teams and eight drivers. We had had to pay the drivers of these teams up to \$8 a day, in addition to the cost of the teams and the outfits. Also we have sold pasture and bought farm land in place of it. There are many other savings—of labor, time and money. Due to the quickness of the big Goodyear Cord Tires, we now can make more hay while the sun shines."—M. W. Bever, Farmer, Colby, Kansas, Rural Route No. 1

IT is everywhere observable, as above, that the traction, cushioning and activity of Goodyear Cord Tires on motor trucks, effect large savings for farmers.

This traction overcomes handicaps of soft, slippery going, of weather and of grade which formerly caused hauling delay and added expense in all kinds of farming.

This cushioning safeguards loads liable to injury, shrinkage or waste when unduly jarred, and thus enables the sale of full quantity and quality at best prices.

This activity permits entirely economical hauling to and from motorized machinery, and by bringing more selling points within hauling range, often reduces marketing costs.

All these virtues of the big pneumatics are made most practical by Goodyear Cord construction which sinews them with unusual strength and endurance.

Farmers' reports on motorization and pneumatics will be mailed to anyone interested, by The Goodyear Tire & Rubber Company, Akron, Ohio, or Los Angeles, California.

Ten Acres a Day Plowed Right Soon Pays for Your E-B Outfit

An E-B plowing rig is built to show you steady, economical work in 1921 and a profit that you'll welcome. For tools that save time and money are the quickest way to cut down cost of farm production now.

With an E-B 12-20 Tractor and an E-B Tractor-plow you can break ten acres a day in stubborn soil. A good day's work, but the tractor never hesitates. And an E-B Plow always does a clean job because it has strength, light draft and the construction that 68 years of experience has taught us is right.

An E-B Outfit bought now will help you save all year.

Fire Prevention on Watersheds

By Stuart J. Flintham, Los Angeles County Forester and Fire Warden

IT IS probably not possible to make every individual realize that the amount of water for irrigation and for domestic purposes depends almost entirely upon the amount of forest and brush cover growing in the mountains. But if a few responsible ones realize this fact, and after realizing it act in cooperation, it will mini-

water content will be lower the year and two years following and will remain subnormal until the brush cover has been returned by nature's slow but healing process.

It is upon this premise that the Los Angeles County board of supervisors has seen fit to base an ordinance recently adopted, which is of the most vital importance inasmuch as it defines the conditions under which fires may be started, if at all, and fixes a definite and stiff penalty for the violation of the ordinance. Under this new law, now in effect, it is unlawful to burn brush, slash, grass, etc., within 500 feet of lands covered with inflammable material, unless a permit is given by the county fire warden or one of his deputies.

The ordinance specifies that it is not necessary to get permits for the burning of trash in corrals, dooryards, on plowed ground, railroad rights-of-way or county roads, providing the fire is more than 50 feet away from lands covered with inflammable material. Permits issued by the warden or deputies will also specify exactly how the fires are to be governed by the party receiving the permit. The refusal of permits under any circumstances is within the power of the officials, and at all times the permits must be taken out by thoroughly responsible people who realize the great damage that can be done through the breaking away of fires in the lowlands that sweep off brush cover or devastate grain and hay fields.

The county is also taking definite steps to cooperate with citizens, communities and corporations, through providing fire fighting equipment in the form of an automobile trailer, loaded with six standard fire extinguishers, eight five gallon galvanized iron water containers, with shovels, mattocks and other material for fire control. This trailer is attachable to any automobile or truck with a chain wrap device. The outfit is built for heavy duty, with the two wheels fitted with pressed-on Goodyear tires, two inch steel axles substantially braced, and with a T-iron braced tongue. The body is of Oregon pine, with compartments to hold the equipment securely during trips over mountain trails. The trailer is being made in quantities for the board of supervisors at a cost of \$400, which is the amount of money asked by the county as reimbursement when the trailers are permanently placed in a locality. The reimbursement funds are turned into making more trailers. The first ten of these trailers have already been placed, or are being negotiated for, as a line of resistance along the Sierra Madre foothills, the Santa Monica mountains and other ranges that ramify from the main lines of hills. The supervisors say that the equipment cannot be bought singly by individuals for less than \$600.

For Fire Prevention on Watersheds

Deputy Fire Warden A. A. Lester is shown inspecting the equipment of the new county fire trailer. The receptacle he is holding is a galvanized iron water container, of which there are eight in the outfit, besides six fire extinguishers, shovels, mattocks and other fire control material.

mize the number of destructive fires.

It is an elementary fact to irrigators and water conservationists that where brush cover is denuded by fire the

Spot Cotton Market

THE most important step taken by the International Cotton League of the West in its meeting in Los Angeles was the endorsement, even the setting in motion, of a movement to secure storage facilities for cotton and the establishment of a spot cotton market. This step was requested by Dr. Geo. P. Clements for the Los Angeles chamber of commerce because of communication from the Los Angeles Cotton Exchange located in Los Angeles. The exchange stated the case in effect that:

"In the United States there are ten designated official spot cotton markets, namely: New Orleans, Galveston, Houston, Dallas, Memphis, Little Rock, Montgomery, Augusta, Savannah and Norfolk. Upon these ten markets the New York Cotton Exchange is forced by law to establish the difference in the price of the different grades above and below the grade middling, by taking the average of the quotations of the whole ten.

"Cotton placed in a bonded warehouse must be weighed by a licensed weigher and classed by a United

States licensed classifier. The two classifiers here are R. C. Rowland, secretary of this exchange, and W. F. Reich. The class and staple will be on every certificate issued from this warehouse by these two disinterested classifiers. This will mean that bankers will know absolutely on what their money is loaned. In loaning money on shoes they would desire to know whether the shoes were Hannan or Douglas and so they will also appreciate the information whether this cotton is good middling or low middling. The present difference in these two cottons in New Orleans is eight cents a pound or \$40.00 per bale. Certificates issued by U. S. bonded and licensed warehouses are as good as U. S. Liberty Bonds."

Under present conditions cotton can be shipped from Phoenix or other Salt River Valley points to Los Angeles and by water to Eastern manufacturing centers for less than it can be shipped by rail from Arizona directly East, in fact the rate is \$1.62 via Los Angeles and water transport as against \$1.82 direct rail cost. This gives opportunity for development of

"FOR THE LAND'S SAKE" USE

AGRICULTURAL CHEMICAL WORKS
518 I. N. Van Nuys Building Los Angeles, Cal.
Telephones: Pico 3619; Home 66022

a great market for Los Angeles. It is understood that warehouses are available at Los Angeles harbor.

Reports from cotton producing sections indicate most serious condition confronting all cotton growers. In some sections Mexican laborers, weakened by starvation rations; in other cases, laborers arrogant because of necessity the grower is under to market his crop soon if it is marketed this season, and again the discouraging condition of the cotton market have made it impossible in many cases for the grower to harvest any of his crop. Some cotton will remain in the field unharvested, while a vast number of plantations will be given simply the once over. The securing of labor is so serious that resolutions were presented and unanimously carried, in effect that because of the need of the cotton grower and the "ill-advised and uncalled for interference with and unjust criticism of the operation of the Imperial Valley Growers Association in its work of importing and furnishing Mexican cotton pickers to the farmer in the Imperial Valley on the part of certain employees of the state of California, connected with the state housing and immigration committee and the state labor bureau, now therefore be it resolved by the International Cotton League of the West in executive session in the city of Los Angeles, November 19, 1920, that the governor of the state of California be requested to curtail the activities of the above mentioned individuals and that a copy of this resolution be sent to the governor."

In the matter of seed it was reported that there was sufficient Pima to plant 75,000 acres, which was sufficient for Arizona and San Joaquin Valley sections. The setting apart of certain sections for pure seed production was urged.

ALMOND VARIETIES FOR POLLINATING

The question often comes as to planting together of varieties of almonds so as to secure perfect pollination. It has long been observed that some orchards planted of various varieties bear much better than others. We have table prepared by the college of agriculture giving the following varieties as intersterile, interfertile and also giving order of ripening. These are the varieties:

Intersterile: Nonpareil and I. X. L.; I. X. L. and Peerless; Languedoc and Texas.

Interfertile: Nonpareil and I. X. L. with Ne Plus Ultra; Drake with Nonpareil, I. X. L., Ne Plus Ultra, Peerless, Jordan; I. X. L. with Drake, Jordan, California, Languedoc, Ne Plus Ultra and Texas; Ne Plus Ultra with California, Drake, I. X. L., Languedoc, Nonpareil.

Order of ripening: 1, Nonpareil; 2, I. X. L., Jordan; 3, Ne Plus Ultra; 4, Peerless, Princess, California, King, Silver; 5, Golden State; 6, Lewelling; 7, Drake; 8, Languedoc, Texas.

California is best pollinizer for varieties blooming at nearly same time.

SHORT COURSES

Short courses at Chaffey Junior College of Agriculture, Ontario, began last Monday morning with sessions which will last for two weeks. The classes on gas engine and farm mechanics continue up to and including December 10. There is also a general section covering matters of soil fertility, farm labor, pruning, insecticides and sprays and other studies of interest to orchardists. There is a citrus section with lessons on general orchard problems, fertilization, diseases of citrus trees, pruning of both oranges and lemons and even touching upon inarching for gophered trees. A. C. Hargraves is in charge of the gas engine and farm mechanic section, while in the general section the addresses and lessons are in charge of W. P. Kelley, M. E. Hill, E. H. Richardson, G. P. Weldon, Harry S. Smith, Geo. H. Hecke, G. P. Gray, Walter Mulford and A. D. Shamel. The citrus lessons are in charge of citrus specialists, including C. J. Booth, W. M. Mertz, H. J. Ramsey, E. L. Dreher, H. S. Fawcett, G. G. Laidlaw, E. S. Lewis, R. S. Woglum, H. J. Quayle, C. P. Wilson, C. S. Milliken. Addresses and lessons in the deciduous section are by G. P. Weldon, H. R. Stanford, J. A. Campbell, R. S. Valle, R. E. Smith, C. A. Perrin, E. L. Overholser, L. B. Scott.

AVOCADO OIL

At the branch United States Citrus By-products Laboratory in Los Angeles, E. M. Chace, chemist in charge, has expressed the oil from 50 pounds of the Chappelow avocado, contributed by W. H. Spinks, Duarte. It was found best to first partially dry the pulp before attempting extraction. The fruits analyzed but 14.58 per cent of oil and as eight to ten per cent is not recoverable, remaining with the cake, the amount obtained was not large. A pound will be collected by Mr. Chace and forwarded to Washington where its chemical constituents will be determined. In its raw or unrefined state the oil is a beautiful emerald green, rather tame to the taste, having none of the nutty flavor present in the better varieties of avocados. No probable or possible use is at present suggested for the oil except, "It may make a good salad oil," and while the present price of the fruits precludes its manufacture, a heavy drop of fruits may sometime furnish material for further experiment.

NEW CEREALS AT UNIVERSITY FARM

The field crop department at the university farm is to test a larger number of new cereal varieties this season and has recently received an extensive collection of new hybrid wheats and barleys from the Maple Grove Seed Breeding Farm in Saskatchewan, 11 wheat varieties from the Minnesota experiment station, 16 new wheats from India, 33 wheats from the Washington state experiment station, six hybrid wheats from Western Australia, 20 wheats from Perth, Australia, 13 wheats from the Longerenong agricultural college, Doon, Victoria, Australia, and numerous other lots of miscellaneous cereal varieties from the various state experiment stations. These will all be grown on the experimental plots at the university farm this season in competition with standard varieties.

Try This
STUMP PULLER
30 Days FREE
At My Risk

Prove on Your Own Stumps That the Kirstin Way is the Cheapest Way to

Clear Your Land!

Don't send a penny of money. Just send for your Kirstin Stump Puller on my generous offer. I'll send it for you to try 30 days at my risk. When puller comes try it on your biggest, toughest stumps—along side any other puller. See what a wonderful, easy-operating, fast-working, strong, substantial machine it is. How ONE MAN ALONE pulls big, little, green, rotten, tap rooted stumps—also trees or brush. No horses or extra help needed. No digging, chopping or other expense. **Prove all my claims! If satisfied, keep puller, if not, return at my expense. No risk to you. Six months to pay.** Coupon below brings full details.

Kirstin ONE MAN Stump Puller

The wonderful all-steel Kirstin is guaranteed 3 years against breakage—flaw or no flaw—weighs less, costs less. Has greater speed, strength, power. **Lasts longer!** Due to scientific leverage, a few pounds on handle exerts tons on stump. Has several speeds. Low speed starts stump—high rips it out quick. Patented quick cable take up saves time, cable and machine. Single, double, triple power! The Kirstin cuts land clearing costs way down. Works in swamps, boggy soil, thick

timber on steep hillsides, where horses can't work. Enables farmers to turn land-wasting stumps into big harvests—besides increases land value by thousands of dollars. Quickly pays its cost. Also often pays for automobile, other comforts and luxuries. Pronounced by Government Officials, University experts, Land Clearing Contractors a phenomenal success—the cheapest, easiest way to clear land.

Read These Strong Letters

My 13 year old boy easily pulls big solid stumps from red clay with our Kirstin. It does all you claim and more. G. E. Clark, Brampton, Mich.

Last fall I cleared land of stumps up to 34 in. in diameter. However, not a single one sat hard enough to show how much power my Kirstin would develop. Emil Thompson, Culver, Minn.

My neighbors are astonished to see the Kirstin yank out the big ones. It pulls my largest stumps. Martin Peterson, Rio, La.

It is wonderful the power your Kirstin develops. I use it for clearing steep hillsides of oak, pine and spruce stumps and standing trees. I would not be without it. E. E. Frederick, Pocket Ranch, Quincy, Calif.

My Kirstin has pulled probably 4,000 stumps—some Locust stumps with 20 to 25 ft. roots. No stump puller could be better. Adam Billett, Wrightsville, Pa.

One Man Alone Handles Biggest Stumps

Single Double Triple Power

A trial of 30 days on your own farm pulling the stumps you want to get rid of, will prove every claim made for the Kirstin. You'll be surprised how easy it is to pull the biggest stumps—how quickly you can clear your land and what a big saving you will make. Use the coupon opposite. Send for Free Book at once.

California Olives, Purest of Food

By C. B. Messenger

THE tragedy of the olive is not entirely confined to the homes which were devastated because of the poison in the fruit which was sent East something over a year ago. There are homes in California which, depending upon olive orchards for subsistence, will suffer because of the campaign of the importers of green Mediterranean olives and the unfair attack of the Eastern newspapers on the industry, and for all of this the growers are entirely blameless. There is scarcely a form of loss in which the hotulinus poison has not at some time been found. It is not a question of the particular food but of the method by which it is handled. The olive curing plants have learned a lesson at fearful cost, though here again the loss has been because of momentary carelessness—or, perhaps, more correctly, lack of understanding, of the deadly poison which may enter any improperly sterilized food—on the part of a limited number of those engaged in the industry.

Of course, the industry cannot ask for entire exemption from the results of these cases which occurred something over a year ago, but the animus of the fight and the character of it is shown by the following, written by Alfred W. McCann in the New York Globe and printed January 20, 1920:

"Truth, justice and common decency demand that the reputation of the Spanish green olive be cleared of any stain put upon the olive family by the California ripe product."

We believe it may be said today that without question the safest food in the world to eat is the California ripe olive. Grower, packer and all are combining in restoring confidence in one of the most healthful and nutritious of foods. Any of the holdover crop which was not processed at the required 240 degrees has been reprocessed and sterilized so that there can be no question whatever as to its desirability as a pure food. The new crop now being harvested will amount to around twelve or thirteen thousand tons. Of course a large quantity of this will this year be made into olive oil, but during the month of September there was received at the port of New York a total of a half million gallons of Mediterranean produced oil, the import duty on which is now 20 cents per gallon, reduced from 40 cents under the former tariff regulations. Owing to this immense importation the price is rapidly dropping and the oil mills are not offering to buy in any large quantity of oil olives at any price, though it is said the limit price for olive oil manufacture is around \$50 or \$60. One sale has been reported around \$75, but this was for a small quantity of exceptionally fine fruit. The growers are hoping to receive around \$100 for pickling fruit. In fact, some sales have been made at that price. A ton of olives will produce about 38 gallons of oil.

The bulk of the California output at first was largely from south of Tehachapi, but that section now produces only about 20 per cent of the olives of the state, the greater proportion being produced in the eastern foothills of the great central valley. The San Joaquin Valley from Stockton south will produce approximately 38 per cent, while north of Stockton, largely in the foothills of Butte County, there is produced approximately 42 per cent. The increase will be more largely north of Tehachapi during the next two years, for the planting in the San Joaquin Valley has been much greater than in the southern portion of the state.

The question now arises: "What can be done with the coming crop of 12,000 tons of wholesome food?" We understand the packers are willing to go the limit in taking the risk of handling this crop, but there is so much uncertainty that it seems difficult to get definite decision as to disposal of crop now beginning to ripen. The manufacture of oil, which is today wholesaling around \$3.50, does not leave very much return to the grower. Disposal of the crop which may be pickled, or rather cured, on the ranch

is prevented by ruling of the state board of health which was made August 7 in effect that olives shall be deemed adulterated within the meaning of the California pure foods act unless the same shall have been sterilized at a temperature of 240 degrees Fahrenheit for a period of not less than 40 minutes by means of a heating device or autoclave which shall have attached thereto an automatic self recording thermometer or heat measuring device in proper working order and that the temperature records shall be available at all times to the representatives of the state board of health.

The board further orders that the director of the bureau of foods and drugs, California state board of health, be instructed to seize and quarantine all ripe olives which are not produced in conformity with the above regulations and to institute action for their condemnation and destruction.

It seems from this that there will be no possibility of disposal of bulk cured olives. The only escape will be to follow the "home brew" plan, buy fresh olives and cure at home. We believe there has never been a case of poisoning from olives processed by the lye-cold brine method when the fruit has been left in the open vessel and exposed to air. We hope this season's work will show advisability of sale of the bulk olive. Of course, the ruling does not affect sale of dry salt cured olives.

The industry means too much to California for us to allow it to be destroyed; the earnest thought which has been given to this problem must be continued and the next few years devoted to restoring it.

FALSELY ADVERTISED RODENT POISONS

That the reliable manufacturer of commercial squirrel poisons is subjected to unfair competition by his unscrupulous competitor and also by the careless or poorly equipped manufacturer is clearly shown in an article scheduled to appear in a forthcoming number of the Monthly Bulletin of the California department of agriculture, written by Geo. P. Gray and A. C. Wilher of the division of chemistry.

The tendency of some manufacturers to try to increase their sales through misleading and sometimes false advertising is pointed out in the article and an instance is cited in which the lives of children might easily be placed in jeopardy by a highly poisonous preparation falsely advertised as "non poisonous" and "harmless." The poison in question consisted of small, white pieces, closely resembling a popular kind of candy "chews" and strongly flavored with anise oil, a most excellent temptation for the average child. The advertising matter accompanying the preparation made the somewhat surprising and contradictory statements that it is "non poisonous"; contains "a scientifically prepared, tempting bait combined with a deadly chemical agent which affects the gastric juice of rodents only," and "is perfectly harmless when eaten by dogs, cats, fowl and even humans, as the chemical agent in the cubes affects only the peculiar gastric juices of rodents."

Examination of the sample disclosed the fact that it contained nearly one-third of its weight of barium carbonate, a poison rated by toxicologists as being violent poison to human beings even in small amounts. A case is on record where a woman was severely poisoned from taking two and one-quarter grains of the chemical.

The writer of this article urges that some means be provided for prohibiting by law the sale of such poisons advertised as "non poisonous," "harmless," etc., and maintain that the greater harm in allowing such preparation to masquerade under false and misleading labels and advertising matter lies in their menace to human life and not in their possible ineffectiveness against rodents.

ALMONDS: A BIT OF HISTORY AND METHODS OF CULTURE

(Continued from Page 719.)

ways an easy tree to grow where conditions are favorable, it is more particular in its requirements than most common orchard fruit, and the grower may find it difficult to produce a good, thrifty tree unless he chooses the proper location. Very often the almond tree will grow well and make a fine, healthy tree, but owing to unfavorable conditions will not bear regularly, if at all. There are only certain districts in California where the dangers of frost and extreme heat are minimized; therefore, we hesitate to recommend any particular district without scientific counsel and advice.

Having located in a proven district where proper soil and water conditions are favorable, the next step is tree selection—only healthy, hardy stock can produce almonds that will meet the high standard set by the Blue Diamond brand almond. Trees growing to a great height are unprofitable, for it costs more to harvest the crop after they are grown than market conditions warrant.

Almonds are not "picked" in the strict sense of the word, but sheets are laid under the trees and the almonds are knocked from the tree with long poles. So it is readily seen that trees of about 25 or 30 feet in height are more easily harvested than the old variety of trees that were planted in the early days by the pioneers, and grew to a height of 50 or 60 feet.

The almond grower of today must use scientific care in the production of Blue Diamond brand almonds. Nothing is left to chance. The study of variety is one that requires consideration. The public generally knows almonds by the terms hard shell and paper shell. Naturally, to meet the popular demand, soft shell varieties should be selected.

Plant hybridization and culture are very important. For pollination of almond trees, bees are placed in the orchard. In the setting out of trees distance and varieties are chosen according to district and location. Almond trees must have plenty of sunlight and air. In the setting of trees the utmost care is necessary to secure a uniform stand of vigorous trees. Pruning is one of the best means of securing and keeping healthy, productive trees, but it requires careful, thoughtful and systematic pruning throughout the entire life of the tree.

The almond is the first of all trees to bloom; the beautiful blossoms of white and delicate pink are the first to appear. They burst forth usually late in January or the early part of February, according to the district.

Blue Diamond almonds are produced and grown generally in the more northern parts of California. There is only one county in Southern California, Riverside County, that produces almonds in sufficient quantities to warrant the forming of a local association. This association is a member of the exchange.

The Almond in History

The almond is supposed to have found its way into California from Europe about 1853. It came to us after long centuries of existence, with many of the imperfections that characterized its early career. To a Californian, A. T. Hatch of Suisun, is given the credit of first having undertaken the improvement of the almond along scientific lines. So marked were the results obtained by Mr. Hatch that the leading commercial varieties of almonds grown in California today are designated as Hatch varieties. Chief among these are the Nonpareil, the I. X. L., and the Ne Plus. These are the leading and highest priced almonds produced in California at this time, and when marketed under the celebrated Blue Diamond brand are the choicest almonds produced anywhere in the world.

While Mr. Hatch greatly improved the quality of the almonds, the varieties originated by him, when planted in the orchard in solid blocks of a single variety rarely give a satisfactory yield. The quality of the product was improved at the expense of the output. To obtain cross-pollination and increased yield it has been found to be good practice to alternate the Hatch varieties with some harder tree. Years ago hard shell almonds

were used for this purpose, but now the Drake or other soft shelled seedling varieties are generally used because of their higher market value. Usually two rows of the soft shelled varieties alternate with four rows of the Hatch varieties. Planting in this manner is advisable to facilitate gathering, which will later be explained. The rows should run, as far as may be, at right angles to prevailing winds at the time of blooming, viz.: if the prevailing winds are from either the north or the south, run the rows by varieties east and west. This matter should be given the closest attention.

No general rule can be given for the distribution of the several varieties of almonds that will apply to all sections. Experience is the only safe guide as to what varieties should be planted in any given locality.

The almond is perhaps the oldest food staple known to man, being referred to in Genesis 43:11. Also the famous rod of Aaron mentioned in Numbers was taken from an almond tree. So, too, the rod cut by Moses, that afterwards became a serpent

when cast down, was an almond branch. There are many Biblical references to the beautiful pink bloom of the almond. It has long been a favorite of the Jewish people, being used extensively by them in the decoration of their synagogues.

Old as the almond is, it is grown on a commercial scale today only on the shores of the Mediterranean Sea and in California. Attempts have been made to produce almonds in Arizona and Mexico, but the output in these, and numerous other sections, is consumed by the local demand.

The almond is a tree that requires thorough cultivation. One must not lose sight of the fact that the period of almond growth and activity extends over the greater part of the year. If the tree is to have vigorous buds from which to mature profitable crops, conditions must be such that the moisture nature intended for the trees shall be available at the proper time. In the wild state, in most instances, the trees find sufficient moisture to maintain their existence. With the domestic tree, however, additional

burdens are added. It must not only maintain its existence but it must produce profitable crops.

One of the best means of securing and keeping healthy, productive trees is by careful, thoughtful and systematic pruning. Before the California Almond Growers Exchange was organized, the usual treatment given most of the almond orchards would indicate that the growers considered pruning to be one of the least important of the cultural practices. This has been overcome by cooperation, education and the strict and careful attention to grade Blue Diamond brand almonds up to the highest standard.

KIND THOUGHTS AS TONIC

When you find yourself ready to put the worst construction on the acts of others, when it is easier to believe that an acquaintance passed you without speaking because she wished to cut you than it is to assume that she failed to see you, it is high time to take yourself in hand. Suspicious people need the tonic of kind thoughts and generous judgment.

Do You Know—

**STANDARD PRACTICE**

The use of Timken Tapered Roller Bearings at points of hard service in the great majority of automotive vehicles is proof of leadership established on the tapered principle of design, quality of manufacture, performance on the road, and service to the automotive industry.

that less than 5% of the tractor-owning farmers report dissatisfaction of any kind while 90% express positive satisfaction with the tractor?

that this means that the tractor is making good, and is doing more and better work with less trouble?

that Timken Tapered Roller Bearings have contributed in an immeasurable degree to this success?

that Timkens are not only good when new, but that their adjustability makes it simple and easy to keep them good for the life of the machine, no matter how long it lasts?

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Dates Near Coast

Kindly give me information as to what varieties of the date palm would do best at Anaheim. About what would offshoots and rooted trees cost and where may they be secured? Would want only a couple of trees for home use. Have room for a couple of palms and thought they might as well bear fruit as not, although they might not be of commercial value.—Subscriber, Anaheim.

We fear there are none of the named commercial varieties of dates which would do well so near ocean influences. The date is understood to do best "with its feet in the everlasting waters and its head in the blazing desert sun," and this has proven true as to growing dates in the Southwest. The Coachella Valley, where intense summer heat prevails from June to September, has grown some of the finest dates produced in the world. The commercial favorite there is Deglet Noor. Offshoots from plants of this variety, however, are practically impossible to secure, in any case for no less than \$15 each. Likewise a seedling, which has been grown to bearing age to determine whether it is a pollen bearer or fruit bearer and of a good variety, is high priced. One may plant seeds, however, from high quality of commercial dates, and if large number are planted they may be grown in nursery row until they bloom and it is determined which are male and which are female. Then the fruit bearer may be separated and set where it is desired. More specific information may be had by writing Superintendent of Documents, Government Printing Office, Washington, D. C., and asking for Farmers Bulletin 1016, "Propagation and Cultivation of the Date Palm," by Bruce Drummond. This bulletin contains a list of other bulletins touching upon date culture and also the Year Book of the department of agriculture for 1900 contains nearly 40 pages on the date palm and its culture. W. R. Nutting is making a test of a vast number of seedling dates on his ranch near Fresno, and in his investigation has found several palms in the valley which he has taken pains to pollinate and which are producing attractive fruit this year. In a few years we will know more about dates than we do now and perhaps varieties may be developed which will succeed in Orange County or other near coast sections.

Killing Out Bermuda

I notice in last issue of the Cultivator inquirer wanting to know how to kill Bermuda grass. I will tell you how to do a good job. Plow the land this winter (not too deep) and sow to grain and the grain will do as well as if no Bermuda was there, as Bermuda does not grow in the winter. Harvest your crop for hay or grain and you can pasture and get the feed until August, then dry plow and don't miss any roots (that is, make the plow cut all the land), and in four or five weeks after plowing dry the job is done. Do not harrow or work land after dry plowing; let it dry out well. The land must be dry when you summer plow and do not irrigate until roots are perfectly dead. The plowed surface will soon dry so no sap roots will start. I have done a perfect job on two pieces of land in this manner, killing out Bermuda, salt grass and rag weeds.—I. D. Reinhart, Tulare.

Does Eat Young

Could you inform me through the Cultivator what is the matter with does when they eat their young? The little ones are three weeks old.—Subscriber, Los Angeles.

Does, prior to and at time of kindling, have unnatural appetites. The system, owing to great drain upon it, requires elements that are not obtained in their regular feed. It is wise to supply these. Most all of the weeds and grasses contain these and feeding them prior to kindling will

overcome these appetites. Again, putting a piece of fat pork in cage at time of kindling helps. There are, of course, some cannibals, and where they persist in doing this it is best to make a potpie out of them. The writer feeds a variety of weeds and roots all the time as the "ounce of prevention" is worth more than the hour of vain regrets. Would advise the subscriber getting a good hook on the raising of rabbits and thus obtain a list of the various feeds and remedies.—W. D. W.

Pumpkins for Milk Cows

Kindly tell me if pumpkins are good feed for milk cow?—Subscriber, Puente.

Without question pumpkins are a valuable addition to the ration of milk cows. Henry's "Feed and Feeding" states: "Two to five tons of pumpkins, including seeds, equals one ton corn silage for dairy cows. The seeds contain much nutriment and should not be wasted." It must be borne in mind that pumpkins, beets and similar feeds are more conditioners and appetizers than carriers of protein, that is, such feed should be fed with abundance of alfalfa or other feed rich in protein.

Walnuts in the Great Central Valley

Which is the best walnut for planting in Tulare County, especially which is the best of the four varieties—Eureka, Franquette, Mayette, and Payne? What is the best time for budding walnuts?—Subscriber, Tulare.

Please give information regarding English walnut planting in Colusa County. Would you recommend setting Vrooman Franquette? Are the Franquettes and Mayettes good stock when grafted on Black? Does the seedling bear well? We have heavy north winds at times, but have plenty of water, fine sandy loose soil, and no hardpan.—Subscriber, Williams.

One of California's most experienced walnut growers, J. B. Neff, has given us of his experience in answer to the points raised in the above questions. First answering a general question as to the adaptability of the Sacramento and San Joaquin Valleys to walnuts with good soil conditions (such as our Williams subscriber has), with abundance of water and in favorable years, it is probable the Franquette and perhaps the Eureka will give fair crop of exceptionally fine nuts. It must be borne in mind that there must be sufficient water available to apply at any time the trees may need it. The walnut will not tolerate drouth when it is maturing nuts. Besides, if water shortage is allowed at any time the abundance and luxuriance of the leaves are affected and then a few hours of intensely warm sunshine burns and seriously injures the nuts. Thus far planting of walnuts in the interior valley has been more largely in the Bay counties or at least within reasonable distance of the Golden Gate, or ocean, influence. It must also be borne in mind that local conditions often affect the success of a crop such as walnuts, and hence the best answer for each locality is the orchards of the same kind which have been given proper care in the same community. Besides looking over these established orchards which give the wisest answer, we would use great care in planting too extensively. In other words, experiment according to your means and ability to lose. There is no finer walnut grown in the world than the California grown Franquette. With our limited information as to walnuts in the two sections referred to in the above questions, we would recommend for Northern and Central California experimental use first the Franquette, second the Eureka; other good ones are the Concord and Mayette. As to grafting it is usually done in February or March, according to location, care being taken to set the scions about the time of the beginning of the spring flow of sap as shown by the swelling buds. The stock usually preferred is the wild Northern California Black. The Royal and Paragon are sometimes preferred, especially for damper soil conditions. Re

(Continued on Page 745.)

Drouth Injured Orchards Attacked by Borers

By E. R. de Ong

ORCHARDS in the interior valleys which have been exposed to drouth and high temperatures have in many instances suffered from sunburn, followed by attacks from flat headed borers. Peach, plum, prune, cherry, apple and almond are all being attacked. This insect does not usually attack sound, healthy trees but seems to prefer those which are in a weakened condition. Trees suffering from drouth cannot evaporate sufficient moisture to cool their surfaces, hence they sunburn on the sides where the sun's rays are hottest. These areas harden, the sap ceases to flow freely, and growth is checked. This is the condition which favors the development of the flat headed borer, and here they thrive and multiply until the branch of tree dies and hardens. Other borers may attack in the last stages of injury, or even after the wood is dead and dry, but it is the flat headed borer that usually begins the attack.

The borer, when full grown, is about five-eighths of an inch long, light yellow in color, and with the fore part of the body flattened and very wide in proportion to the remainder. They are found in shallow burrows, a little way under the bark or in young trees they may bore directly into the heart of the wood. The winter is spent in the worm or pupal stage, the adult beetle appearing in spring or early summer. The beetle deposits eggs underneath the rough flakes or barks or any part of the tree, and the larva

or borer which hatches from this egg burrows down to the cambium layer. As already indicated, the beetle prefers to deposit eggs on weakened trees only, but if they have become very abundant in an orchard they may be found attacking healthy trees. Hence the necessity of giving careful attention to the orchard through the winter.

Control

Weakened limbs on trees, that show signs of borer work, should be cut out carefully through the fall or winter and burned. Avoid leaving the brush or limbs piled in or near the orchard until spring. Sunburned areas or patches of dead bark on the trunk, large limbs, and even small twigs, should be examined for borers. If only a few are found, it may be possible to kill them in their burrows with a knifeblade or wire. The wound should be covered with asphalt or grafting wax.

Prevention

Prevention lies more in keeping the trees healthy and with the sap circulating vigorously in all parts of the tree than in applying repellants such as soft soap or carbolic acid, although the latter may be of some value if applied at intervals through April and May or possibly June. The use of a good adhesive whitewash is also desirable for trees just after they have been planted or the stumps of top worked trees or any part of a tree that is not shaded and is exposed to the hot sun.

December in the Vegetable Garden

Southern California

By D. F. Reichard

IT is beginning to look as if we would have to do some irrigating in order to get the ground wet enough to work up for early planting, or even to keep cover crops growing. The rains we have had up to the last of November have soaked in only to a depth of six to ten inches. This is not enough moisture for the dry farmer, but by properly working his ground and with what rains come during the next three months, even though it is but six inches, if he thoroughly cultivates and stirs his ground after each rainstorm he will have retained enough moisture to make a crop of beans, corn, sorghum or grain. For the vegetable grower more moisture will be required, because to make good succulent produce there must be a vigorous growth, and that requires an unstinted amount of moisture. So to the persons intending to start their garden early the suggestion would be to soak up the ground thoroughly during this month before working it up.

Although quite a list of items can be planted with success in the frostless or thermal districts, as a general thing it is not advisable to plant very heavily during December. It is not good growing weather; one will gain more by applying his energies to getting his land in shape for planting a few weeks later.

For succession one may put in a few beets, carrots, turnips, radishes, lettuce, spinach and pea seeds and set out cabbage, cauliflower and kale plants, also get established the permanent plants such as asparagus, artichokes, rhubarb, horseradish and berries.

Your growing crops of peas, cabbage and so on will need a little water, also cultivation, as the rains of last month started the weeds and grass to growing and now is the time to kill them.

Prune the trees and bushes and spray them with Bordeaux mixture or lime-sulphur solution to destroy any fungus bacteria that might be on them.

Northern California

By Albert R. Gould

UTO this date the rains have been somewhat liberal in our northern section. Some of the land should now be in good shape for garden operations. Between the rains every opportunity should be taken to get the various plots ready, and many of the early spring crops will need attention by cultivation, etc. Seeds of many others may now be sown. This will be cleaning up month, and all refuse, weeds, etc., should be trenched in or plowed under as it is all of value to the soil. We have often advocated rotational cropping in these notes for several reasons. This method checks the devastation of insects and fungus diseases by moving the locality of the crop which they affect. Again, the advantage of planting a leguminous crop, such as peas or beans, and following it up on the same plot with beets, potatoes or cabbage, is that the later crops have the benefit of the nitrates left in the soil by the first named crops. To get good results therefore it is advisable to practice this system.

Radish

Winter varieties such as Rose winter, White winter and Black Spanish may still be sown in rows 18 inches apart. Thin out to six inches in the row.

Lettuce

Sow Los Angeles and Big Boston, two large heading varieties. They require a fairly rich soil. Sow the seeds in rows 18 to 20 inches apart. Later thin the seedlings to six inches apart in the row. A hardy crisp variety is White Paris Cos, often called Romaine. This may also be sown now.

Onions

Much cultivating will be needed through the plots of the early varieties as these will be now making rapid growth. On the plots prepared for main crop varieties sow Ailsa Craig, Prizetaker and Australian Brown. A good white variety is Southport White Globe, a fine keeper. Sow in rows 24 inches apart to allow for using the wheel cultivator. There is

FAGEOL

WALKING TRACTOR

This tractor is so simple in design and so sturdy in construction that it can absolutely be depended upon to work continuously day after day. It is so easy to operate that any farm hand can care for and drive it.

Its usual consumption of fuel is under a gallon per hour, and one pint of oil per day is enough.

GRAIN AND COTTON SEED

BUNYIP, BAYAH and DART IMPERIAL SEED WHEATS

California acclimated Australians; best milling; higher prices for product; yield well; shatter less in wind than other varieties known to us.

MARIOUT

There is large demand for this early maturing, drouth resistant barley. Car load just shipped Miller & Lux averaged approximately 130 lbs. per sack. All our re-cleaned Mariout, when well-jigged, has approximately such weight.

All our seeds grown on new soils, one irrigation only. All water from deep wells. No Bernzuda, Johnson or Morning Glory.

Last call for Beldi Barley, Sonora, Early Baart, and the so-called Diener Hybrid Wheats, but can yet supply less than car load lots. No Tennessee Winter or Four Thousand Barley.

DURANGO and MEBANE COTTON SEED

Fully matured seed from purest strains known to us, grown in selected hand-rogued fields. We operate our own gin, carefully avoiding seed mixing.

All seed orders, whether car load lots or less, booked as received, shipments following consecutively.

Write for prices, stating quantity desired.

still time to plant onion sets for early onions.

Spinach

This is an excellent spring crop. Seeds sown now of the New Zealand variety will furnish a lasting supply of green vegetable as this may be cut frequently. Bloomsdale Savoy is also a very fine variety for early spring use. Sow in rows 18 to 24 inches apart.

Peas

Sow for succession Little Marvel, Laxtonian and Blue Bantam, all early varieties. These should be sown in fairly rich soil in rows two feet apart. Dust those previously sown with arsenate of lead to prevent the birds from destroying them as they are fond of the young shoots.

Asparagus and Rhubarb

Plant strong roots of Palmetto and Conover's Colossal, two of the best varieties. Plant the roots in trenches well manured 6 inches below the level of the bed with the rows 3 feet apart. Rhubarb should be treated the same, and the best varieties of these are Myatt's Victoria and Crimson Winter. The latter produces throughout the season.

Turnips and Kohl Rabi

Sow these in rows 12 to 18 inches apart in rich soil. Both crops mature quickly and successional sowings should therefore be made throughout the season. They require plenty of

water. Sow Early Snowball and Early White Flat Dutch turnips and Early White kohlrabi thinly. The tops of these may be used as a green vegetable.

Southern Arizona

By M. E. Bemis

THE garden work for December, so far as the seeds which may be planted in December, is not materially different from the plantings made in November. These include beets, carrots, lettuce, parsley, parsnips, peas, radishes, spinach and turnips. Also the following plants may be put out: cauliflower, cabbage, strawberries. Unless the weather is quite cool, germination of above mentioned seeds is likely to be more satisfactory than in the early month's plantings. I find that my plantings in the latter part of September of such seeds as beets and lettuce are very irregular in germination, only a small percentage coming up, while plantings in October and November show a very much larger percentage of plants. As a rule radishes, turnips, mustard and sometimes beets are of a higher percent germination than some other vegetables. Liberal use of seeds under irrigation conditions is advisable. Notwithstanding advantages of irrigated gardens, we have to admit that germination is one of the serious problems. In planting at this season of

the year it is well to remember a little kale and Swiss chard for the chickens.

Some who have had considerable experience with strawberry plants put out at this season of the year say they will do just as well as at any other time of the year. The well known variety, Arizona Everbearing, has proven as desirable and probably has more friends than any other variety grown here. A sandy, loamy soil, if well fertilized, so that there is humus to lighten it, produces well, and, as is well known, such soils are stronger in fertility than lighter soils. The strawberry bed should be ridged

and for horse cultivation 30 to 36 inches apart and ridges six to eight inches high from the bottom of furrows, and plants 12 to 14 inches apart on the sides of the ridges. Only strong young plants should be used and these should be set a little deeper than from the soil from which they were taken, although not deep enough to cover the crowns. The Blue Ribbon and Texas, also the Lady Thompson, do well.

Although the growth of gardens planted for December is ordinarily slow, by cultivation a moderate root growth at least is induced and earlier maturity hastened.

December in the Ornamental Garden

Northern California

By A. R. Gould

THE active planting season for shrubs and other ornamentals is at hand and nurserymen are busy filling orders. We have given from time to time in this column a large selection of choice subjects which will be found suitable for our northern section of the state. It is always a wise plan to make special note of anything you may admire in the way of trees, shrubs or flowers and as the proper

planting season arrives you may have the joy of adding this to your own garden. Roses and the climbing vines such as wistaria, jasmine and honeysuckle are all favorites and may be seen on the porch a wealth of bloom. Some may be anxious to establish a garden which will require the least attention and yet provide some flowers to cut, and there are perennials and flowering trees and shrubs which one may use to attain this end. Trees coming under this heading are: *Acacia baileyana*, *A. cultriformis*, *A. floribunda* and *A. dealbata*; *Eucalyptus crebra* and *E. saligna*, both very ornamental trees, are not such rampant growers as others of this family. The catalpa is also a very beautiful tree when in flower. Other trees to select from are the Lawson cypress, Monterey pine and Coulter's pine (having the large cones), *Sequoia gigantea* and *S. sempervirens*, the redwoods, *Abies excelsa*, *A. pinsapo* and such handsome cedars as *C. deodara*, *C. atlantica glauca* and *C. libani*. The purple plum tree gives a touch of color and the weeping birch is attractive. Of the flowering shrubs one may use *Spiraea Van Houttei*, *Philadelphus inodorus*, *Genista juncea* (Spanish broom), *G. monosperma*, *G. andreaeanus* and *G. canariensis*, all worth planting. Then we have *Berberis Darwini* and *B. Thunbergi*, *Abelia grandiflora*, *Deutzia gracilis rosea* and *D. Lemoinei*, and lilacs in variety. For shady places or the north side of the house you may plant fuchsias, of which there are a variety of colors, and hydrangeas in white and pink. For the flower borders for early spring flowering plant bulbs of course, snowdrops and crocus to flower early, also daffodils, hyacinths, narcissus, iris and tulips, early and late varieties. *Ranunculus* and anemones are also useful for cut flowers. For edging the borders use English daisy, violas, pansies, dianthus or pinks. Other flowers to give a succession of bloom are Shasta daisy, geum Mrs. Bradshaw, campanula, helenium, heuchera, sunflower hollyhock, forget-me-not, lupine, phlox, primula, verbenas, candytuft, marigold, petunias, delphinium, godetia, ageratum, antirrhinum, stock, lobelia, zinnia, aster, gaillardia, gerbera and foxgloves. Many of the above flowers are perennials, that is they last from year to year and require subdividing of the roots every three years or so. Most of these may be secured and planted this month and the annuals a few months later. However, the ground must be prepared by thorough cultivation and manuring and the flower beds laid out.

General Work

The dead wood must be cut out of the rosebush, whether climbing or dwarf types, and all flower beds clean weeded and dug, applying manure liberally at this time. Hedges should be trimmed, such as cypress, box and privet, cut well back to keep them in good shape. Cut off all dead flowering shoots from hypericum, escallonia, etc.

Propagation

Cuttings of box, privet, euonymus and hydrangea may be inserted in sandy soil to root.

Winter Flowering Sweet Peas

These should now be coming into

Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

flower and will require feeding with liquid manure. Another sowing may be made at once in well prepared soil if a succession of bloom is required. There are now quite a number of very fine waved varieties to choose from in a wide range of color.

Wall Climbers

Many ask, "What is the best climber that clings?" There are several. Ficus repens, once established, is a fairly rapid grower; Ficus minima gives delicate tracery on wall or rocks; Big-nolia tweediana for the warm side of the house has fine yellow flowers and Ampelopsis veitchii (Boston ivy) will solve the question for many who have bare walls to cover.

Southern California

By Ernest Branton

DECEMBER is of all months the best one for planting roses. While one may get them balled or potted or canned, dormant bare root plants are preferable. Secured in this condition one has a field grown free rooted plant that is ready at once to assert itself in an extensive feeding zone with a large and vigorous root system which promises much in large fine blooms. Potted, canned, or even balled plants are of lesser value.

December is the last month in which Holland or autumn bulbs should be planted and is a little too early for the planting of spring bulbs. Aside from native Californians, other bulbs should be left out of the month's planting list. But all hardy trees, shrubs, plants and vines may now be set out, though this month is no better than January for such work. It is merely a matter of when you have the most time, taking time by the forelock, or not putting off for tomorrow what you may do today. If you have occasion to turn soil up at this season, let it lie and weather in the rough for a time. At no season is such treatment more needed. Then, when rains beat it down, spade up again and pulverize. Such soil stirring is profitable, but do not forget to turn down some fertilizer at the first spading. Never work with but one end in view when you may have two.

Sweet peas bring a glorious spring crop when planted in December; if planted later the blossoms appear with the first hot weather and that is fatal to size of blossom, length of stem, also clarity of color in the dark red shades. This is the month for sowing seeds of early spring flowering annuals as well as of hardy biennials and perennials. Native flower seeds, alyssum, calendula, candytuft, coreopsis, forget-me-not, foxglove, grassflowers, larkspur, mignonette, pansy, salpiglossis, snapdragon, stocks and verbenas are a general list for present planting.

If you wish the occupied space between now and April take up bulbs or dahlias, roots of cannas, elephant's ears, ginger lilies and other tropical plants and store in a cool, protected, shaded spot where they may remain dormant until the appointed time. Get the soil ready for the big summer flowering gladioli for they thrive as well from January planting as from any. If stable manure is worked into the soil it should be thoroughly rotted for fresh manure is not good for any bulbs or plants if it comes in contact with them. If pansies are planted the soil should be most thoroughly pulverized; they will not thrive in rough soil.

December is a season of some don'ts. Do not prune any plants except it be mere thinning of fruit trees. Shears cut away spring flowers in both deciduous and evergreen plants. If heavily pruned now, and warm weather comes, new growth or premature blossoming may result and frosts following will destroy. Neither shall you fertilize lawns yet, for plant food will be washed away or below the root zone, leaving nothing but the organic matter to benefit the soil through slow decay, if indeed decay comes to matter lying on the surface. After excessive rains have ceased (granting they will come) plant food will largely remain in the soil, and not till then does spring growth begin, so why fertilize earlier? Then, too, is the best time to make new lawns or renovate old ones.

The **DEALER** says=

"the **GIANT** mark protects you from imitations"

"It pays me to give my customers what they ask for," says the retailer who knows what's what. "When they ask for 'Giant Powders' I give them GIANT Powders—the real Giant, made by The Giant Powder Co., Con. I don't tell them that 'I have the same thing, only under another brand name,' because it is not true.

"The name 'Giant' on a case or a stick of powder is evidence that the powder is made by the company that originated Giant Powders. Remember this: You can't get Giant results when you use ordinary dynamites that look like Giant but aren't marked Giant."

Look into the new, money-saving methods of clearing land, blasting tree beds, ditches, boulders, etc. They are all described in our up-to-the-minute book, "Better Farming with Giant Farm Powders." A post card will bring it by the first mail.

THE PHONE BELL

She ran to bake his pancakes,
And the phone bell rang.
She rushed to start the coffee,
And the phone bell rang.
Breakfast—he went without it;
"Good-bye," they had to shout it;
She would have wept about it,
But the phone bell rang.

She tried to dress the children,
And the phone bell rang.
She went to wash the dishes,
And the phone bell rang.
The parlor needed dusting.
The chafing dish was rusting,
And the silverware disgusting;
But the phone bell rang.

The grocer stopped for orders,
And the phone bell rang.
A neighbor came for gossip,
And the phone bell rang.
She thought by being hasty
She could make some biscuits tasty;
Her hands with dough were pasty
And the phone bell rang.

All day the housework waited,
While the phone bell rang.
No time for rest and labor
When the phone bell rang.
At last he came to fold her
In his arms, "Poor girl," he told her,
And the phone bell rang.
—Newark News.

THE RENUNCIATION OF CLAIRE

By Margaret A. Condon

WHEN Peter Norton's health became impaired and his physician indicated outdoor life as the remedy, Peter invested the bulk of his financial resources in the purchase of a ten acre ranch, where he and his pretty young wife, Claire, settled down to make their home. As both were intensely interested in agricultural pursuits, their apprenticeship in farming methods was along pleasant lines.

"I love it, Peter," Claire said, slipping her hand into Peter's, as they stood one evening on the tiny veranda of their very small house, viewing their little domain. "I love every bit of it. It is our very own, and best of all, Peter, you are growing strong and well. If—" and this was an "if" of tremendous import to Claire—"we only had a better house."

Peter acquiesced cheerfully, in fact, he usually did acquiesce in all that his winsome Claire propounded, for they were lovers true.

The venture was a success from the beginning, and with the aid of his two Mexican helpers Peter had accomplished wonders during this first season. Well content was he to be freed from the thralldom of city life, and happy in his improved health.

Beautiful in its setting was the little ranch, lying on a slope between the foothills and the sea, with a wonderful outlook over the valley. Several acres were well stocked with fruit trees, and a tall fringe of eucalyptus extended across the entire rear of the property, as well as across a one acre lot adjoining their land on the north, thus protecting the ranch from the vagaries of the sea breeze when it swept too strenuously up the valley. In front of these tall sentinels stood several magnificent live oaks, and from a little ravine rose three gnarled old sycamores. Altogether they formed a wonderful little grove. In among the openings beneath the trees Claire had planted violets, narcissus and many vines and shrubs that seek a partial shade. Here was a veritable birds' paradise, with saucy mockers much in evidence. At times even a few shy quail ventured down from the hills, to flit about in the friendly shelter of the grove and marvel at its loveliness. When the sun went low, the sky crimsoned, and the red gold filtered through the great trees, it made of the little ranch a picture with a marvelous background.

To the grove Claire beguiled Peter in his leisure moments, to rest beneath the trees and breathe their pungent healing odors. Here, too, came "Johnny-jump-up," Claire's snow white kitten, who usually preceded them, his tail standing straight up in a manner peculiar to himself, and waving as he ran. His name was derived from another of his peculiarities, which was to jump without warning into the lap of anyone who was seated and gave evidence of friendly feelings for his kind. Taking him all in all, "Johnny-jump-up" was a most lovable cat.

Summer was crossing the threshold—not creeping, but striding in as its wont in California. The silvery

sheen of oats and barley undulated in the breeze. Never was alfalfa of so emerald a tint, never fruit trees gave promise of so abundant a harvest, or so it seemed to Peter and Claire, and Peter's cheery whistle through the long sunny hours said that all was well.

One day there came to the acre lot adjoining the ranch two men, who paced and measured the land and discussed some matter at length. Soon afterward lumber, brick and other building paraphernalia began arriving. Workmen came, and the foundation and framework of a roomy modern bungalow arose as if by magic.

Peter came in to luncheon one day to find Claire greatly excited.

"I have found out all about the new house, Peter," she said. "The agent of the owners drove out today and I talked with him. They are building it for a Mrs. Walford and her invalid daughter, who are coming here to live. They are in comfortable circumstances, and he said we would find them very pleasant neighbors."

Peter returned: "It'll be jolly for you to have pleasant people near when you are alone in the house so much, and make things less lonely for you."

Claire's interest in the prospect was intense. Quickly the house was finished complete, but the owners had not yet appeared. The furnishings began to arrive, and everything was made ready for occupancy. The interior was beautifully finished, dainty curtains hung at the windows, pastel colors predominated in the pretty rugs that matched the delicately tinted and figured wallpapers, and everything indicated refined and artistic temperament on the part of those directing the work.

Poor Claire! She watched the development day by day. Several times she had been through the house, knew every room and its fittings as intimately as if it were her own, and could not help comparing it with the inadequate three room house that she and Peter occupied. Jealousy or envy had no part in Claire's character, but she was saddened by the contrast.

The brown summer was well advanced and so far nothing had been seen of the expected occupants of the new house, when one morning a motor car drew up at the gate and Claire recognized the agent who had first spoken to her about the house. He came up to her door, greeted Claire courteously, and said:

"I have sad news, Mrs. Norton, of your prospective neighbors. Miss Walford, the invalid for whom this little home was prepared, died about ten days ago."

Claire looked up with a startled exclamation as he continued:

"Since she is alone now, Mrs. Walford has given up the idea of coming to the country and will offer the place for sale."

"Dead! For sale!" Claire echoed. "How sad! They never had an opportunity to see their beautiful little house, and now it will go to strangers," and Claire's blue eyes were misty with sympathy for the erstwhile expected neighbors, whom now she was never to know.

"Yes, it is very sad," the man of business returned perfunctorily. "Mrs. Walford feels her daughter's death intensely, and prefers not to visit the place. It is in my hands for sale. Might I intrude upon your goodness, Mrs. Norton, by leaving a card with my business address? Of course I shall placard the house, and some prospective purchaser might happen along and wish to inquire of you about it. I might say it will be sold at a very reasonable price—only five thousand dollars, with all furnishings included."

"I shall be pleased to do anything I can," Claire returned mechanically, for her thoughts were elsewhere. A wild hope had sprung up in her heart. "If only—if only—but what was the use? They had not the money to spare. At any rate she would suggest it to Peter," and she waited impatiently for him to come after the agent took his leave.

"What's up, Claire?" Peter queried, as he noticed her flushed cheeks and excited manner when he came in to luncheon. "I see you had a visit from your friend the agent."

"Oh, Peter!" Claire cried. "Miss Walford is dead. Her mother will not come here to live now, and the place is for sale."

Peter whistled softly. "Hard luck," he said. "Poor ladies! They never had a chance to enjoy their little home."

"I'm so sorry for the mother, who does not even want to look at the place now, she feels her daughter's death so deeply," Claire continued.

"The place is to be sold, you say, Claire? I wish we had the money to buy it."

(Continued next week.)

HINTS FROM HOUSEKEEPERS

Escalloped Oysters

As the holiday season draws near we naturally turn to recipes for something different from the usual menu. Here is a recipe that I have never seen in print and which many think delicious:

One quart oysters, butter 2 ounces, milk 1 pint, 2 eggs, salt and pepper, crackers 1 pound.

In a baking dish place a layer of cracker crumbs, a layer of oysters, a layer of cracker crumbs, etc., placing bits of butter in between layers, with pepper and salt to taste, placing crackers on top. Beat eggs, mix with milk, pour over all in baking dish. Bake about 30 minutes in moderate oven.—Mrs. L. M. Huhbell, Woodland.

Hard Soap

In the Cultivator of November 6 a Bakersfield subscriber asked what caused her soap to turn rancid. A Thermal housekeeper who has had much practical experience writes just how she secures satisfactory results:

Add one can of lye to 3½ pints of water in enamel container. Stir lye until dissolved, as lye will make the water hot, and let it cool while you dissolve 5½ pounds of beef fat or pork fat that has been clarified. Do not let the grease get too hot. Break up the fat in small pieces; it will melt quickly. Remove grease from stove and with a wooden slab stir grease as you gradually pour the lye water into it. If one should get the mixture too hot, just keep stirring until it cools and it will soon thicken like honey in summer time. Stop stirring when you see it is going to set. Cover with cloth until firm enough to crease. Cut in oblong pieces.

I have a ready sale for any surplus soap. I note some recipes call for too much fat for amount of water used, as I experienced by following one recipe. I afterwards broke the soap into pieces and added more water and boiled until the right thickness.—Mrs. A. Waknitz, Thermal.

TO RENEW GILDED PICTURE FRAMES

Picture frames become soiled and shabby as do door and window frames. If they are gilded frames they are more delicate than the trim of rooms and become soiled even more easily.

Washing frames sometimes freshens them up, but the best way to do it is to go to the paint or drug store and buy a little package of bronzing liquid.

For some reason these liquids do not come mixed ready for use as does paint. The solution or liquid is in one compartment of the can and the bronze powder in another. It's a very simple matter to compound them when ready to do some gilding.

It takes but a few moments and costs but a few cents to re-gild a frame and you've no idea how it brightens up a room to have the gilt picture frames treated as suggested.

CANNY FINANCE

A man from the north of Scotland was on holiday in Glasgow. On Sunday evening he was walking along Argyll Street when he came upon a contingent of the Salvation Army, and a collection bag was thrust in front of his nose. He dropped a penny into it.

Turning up Queen Street, he encountered another contingent of the Salvation Army, and again a smiling "lass" held a collection bag in front of him.

"Na, na!" he said. "I gied a penny tae a quad o' your folk roon' the corner just the noo."

"Really?" said the lass. "That was very good of you. But then you can't do a good thing too often. And besides, you know, the Lord will repay you a hundred fold."

"Aweel," said the cautious Scot. "jist wait till the first transaction's feenished before we start the second."—London Tit-Bits.

AVOCADOS, THE BEST EVER!

NE taste of a good ripe avocado does it! It has that haunting, delicious, come-again taste that promptly forms the avocado habit.

The most enthusiastic avocado lovers say the fruit can't be improved by addi-

YOU don't use as much of Calumet as you do of most other Baking Powders. It has more than ordinary leavening strength. You save about half.

You don't pay a big price for Calumet. It's sold at a moderate price—that represents another saving.

You don't feel uncertain as to results. Bakings never fail—because Calumet never falls below the proven standard of "Best by Test."

Use only half the amount usually required

CALUMET
BAKING POWDER

"BEST BY TEST"

It possesses the highest quality ever put into a Baking Powder. Contains only such ingredients as have been officially endorsed by United States Food Authorities.

For weeks, for months, it keeps as fresh and full of strength as the day it left the Calumet Factories, the World's Largest, most Sanitary and Modern Baking Powder plants.

Pound can of Calumet contains full 16 oz. Some baking powders come in 12 oz. instead of 16 oz. cans. Be sure you get a pound when you want it.

Calumet Gold Cake Recipe

Yolks of 8 eggs, 1¼ cups of granulated sugar, ¾ cup of water, ½ cup of butter, 2½ cups pastry flour, 3 level teaspoons Calumet Baking Powder, 1 tablespoon of vanilla. Then mix in the regular way.

Bartlett Pear on Japan Roots

We still have some fine Bartlett as well as Bosc, Anjou, Comice, Flemish Beauty, Winter Nellis and other leading varieties of pears on Japan Pear roots.

FRESNO CALIFORNIA

tion of any other flavor—unless it is a dash of salt. But for those who like a little variety we are giving some hints published by the California Avocado Association. Secretary R. Agnes McNally of the association informs us that she is now gathering together a book of recipes which will soon be available for distribution.

Avocado In Shell

Cut fruit in half and remove seed. Serve a half to each person with any of the following dressings, as personal taste directs: Lemon or lime juice, salt, sugar, tomato catsup, mayonnaise, French dressing.

Avocado on Toast

Remove flesh with a spoon and mash with a fork. Spread thickly on small squares of hot toast. Add a little salt and pepper. This is one of the nicest ways of serving avocado.

Avocado With Caviar

Prepare as the above recipes direct. Spread a small quantity of caviar on top of each piece. This is a very delicious appetizer.

Avocado Cocktail

Cut fruit into dice. Place in small cocktail glasses, cover with a good cocktail sauce. Tomato catsup with lemon juice and salt and pepper is excellent. Serve very cold or packed in ice.

Celery and Nut Salad

Fill seed cavity of a half fruit with chopped celery and nuts mixed with a small quantity of mayonnaise.

Apple and Celery

Take equal parts of chopped celery and apple. Heap in a lettuce leaf, cover thickly with avocado meat well beaten with a little mayonnaise. Lemon juice may be used if preferred.

Combination Salad

Make a good combination salad of green vegetables—peas, beans, tomatoes, cucumbers, celery, hard boiled egg, lettuce. Mix with one-half as much avocado meat. Season with French dressing.

Avocado on the Half Shell

This is only practicable with the thick skinned variety. Divide fruit in half, carefully remove meat, add yolk of a hard boiled egg and one tablespoon French dressing for each fruit. Press through sieve and pile back in shell of avocado. Garnish with boiled whites, finely chopped with parsley.

Cuban Salad

In the cavity of a small fruit place three stuffed olives, add lime or lemon juice. A teaspoon of sugar dissolved in the lime or lemon juice is very nice.

If You Care for Onions

Cut flesh of avocado in cubes, mix with chopped onions, lime or lemon juice and salt. A finely chopped boiled egg sprinkled on top makes it very pretty.

Aspic Jelly Made With Avocado

One-half box gelatine, one-half cup cold water, one cup boiling water, two cups mashed avocado, juice half a lemon, salt, cayenne. Soak gelatine in cold water one-half hour. Dissolve in boiling water. Strain and add avocado meat which has been flavored with salt, cayenne and lemon juice. Place on ice to harden. Serve with mayonnaise.

With Banana and Apple

Take one chopped apple, one sliced banana and three medium sized avocados. Mix in bowl with either French dressing or mayonnaise. Serve on lettuce leaf.

Sandwiches

A good hostess appreciates the value of an original and delicious sandwich. Mash flesh of three large or six small avocados, season with lemon juice, salt and pepper. Spread between very thin slices of rye bread. A lettuce leaf may be used in the sandwich if desired. This makes about 20 sandwiches.

With Chili Pepper

Chop fruit with chili pepper. Season carefully and spread between buttered bread, with or without lettuce leaf. The above recipe can be used with nuts or olives in place of the pepper or onions.

Christmas Time

The Auto-Wheel Coaster

Try out the Auto-Wheel Coaster Christmas morning. See what a fine wagon it is. Spin the wheels. You'll say it has "Roller-Bearings"—and you'll be right, for the

Auto-Wheel Coaster

has genuine Roller-Bearings. Test its strength. Load it with as much cord-wood as it will hold. Then notice how easy it is to pull. You'll hardly know the wagon is loaded. Then hunt up your pal and have a race. Give him a head start. He'll need it, for the Auto-Wheel Coaster is the fastest boys' wagon in the world. It's a real speed hound, and just naturally eats up distance. Right now is the time to make arrangements to get an Auto-Wheel Coaster for Christmas. Send today for our catalog. It shows all styles and sizes. Pick out the kind you want and tell your Dad about it.

Send us names of three coaster dealers, in your neighborhood, telling which sell wagons with the name "Auto-Wheel" on the sides. With the catalog we will send you a FREE six months' subscription to "The Auto-Wheel Spokesman", our magazine for children.

An Original and Delicious Dessert

Avocado and chopped dates beaten in whipped cream slightly sweetened.

Avocado With Sea Foods

A most appetizing form of serving the avocado is to mix equal parts of cold salmon or lobster with the diced fruit and serve with mayonnaise.

In Soups

The avocado is used extensively in the tropics in all kinds of meat soups. Cut in small cubes and add to the soup just before serving.

For Invalids

The avocado is recommended by physicians as a most desirable form of food for invalids. It is highly nutritious, containing as high as 25 per cent of fat in the best varieties, according to government statistics, and yet is very easily digested, so that the most delicate person can eat it freely.

WOMEN FIND FARM LIGHTING PLANT ESSENTIAL

By N. C. Wilson

THE advent of power implements, simplifying the routine work of the modern farmer, has brought to light the fact that in many cases his wife is drudging under old fashioned conditions in the farm home.

Without an attractive home where up to date conveniences have been installed, farm women naturally are discontented. The contrast between their ceaseless exertion with antiquated appliances, and the easier lot of sisters in the city often becomes the incentive for the whole family to finally desert agriculture.

The working hours of the average farm wife, according to a recent survey of the department of agriculture, are 11.3 all the year, while during the hottest months of the summer she works on an average 13.12 hours.

While the burdens of field labor have been lightened by the inventions of reaper, binder, tractor, tillage and harvesting machinery, the farm wife slaves with comparatively few more improvements than the farm woman of 50 years ago had.

This state of affairs, however, need no longer exist. By installing a farm lighting plant which furnishes an application of power to household tasks, economically, farm life can be made a hundred fold more attractive.

According to the department of agriculture survey, farm women on 79 per cent of the farms in America average one-half hour a day in filling, cleaning and trimming kerosene lamps.

The washing is done at home in 96 per cent of the farms. Only 43 per cent have washing machines to make the task easier, and those who have machines usually own those operated by hand.

Sewing machines on the average farm are run by foot power, and yet the average farm wife must do sewing for five people.

The activity of farm women in the majority of cases is not confined to household duties alone. There is milking to be done, poultry to be taken care of. Usually it is the farmer's wife who operates the cream separator.

On 61 per cent of the farms in the United States the pump or spring is about 40 feet from the house. The farm women carry all the water into the house.

No home needs a vacuum cleaner more than a farm house does. Yet only 24 per cent of the farm women of America have the services of a vacuum cleaner.

While 48 per cent of the farms have power for operating stationary machinery, in only 22 per cent of the farm homes has this been connected with household equipment. This condition does not seem to be in keeping with modern ideas of labor saving.

The expense of the installation of a farm lighting plant is not as much as many other power investments. And it is not only a boon to the housewife but a source of illumination for all the farm buildings, a power which can drive the stationary machinery, pump water, provide power for the shop and make itself useful in a hundred different ways.

The application of power to farm household work is the solution for keeping the women on the farm.

Do you know how to judge a player piano?

Send Coupon for Our Free Books. They Tell You.

Before you go to buy, you ought to be familiar with the details of design and construction that make one player-piano or piano better than another. Our free books tell you.

FEED FOR SWINE,
STOCK AND POULTRY

ASK YOUR DEALER

The Gray Dawn of a Better Day

By A. L. Spellmeyer

ISTRIBUTION of food has become more important and more profitable than its production. Complicated marketing makes high prices, high cost of living, high railroad freight rates, the greatest factor in today's cost of manufactured goods, and high taxes. A man with assets six times his liabilities goes into bankruptcy. All of us are handicapped for money to stand the overhead no matter how solvent our affairs may be. The boasted declines don't exist retail.

Silk is cheaper than for years but what are advertised as bargains would be considered high a few years ago. Shoes are around the \$12 mark with hides unmarketable. Wool clothes are up around the moon with wool almost a presentation. The retailers are kidding us, the government prosecutors, supposed to rectify profiteering, playing to the gallery, the politicians ignoring the fact that the general, first, and only issue now before the people of this nation is the high living cost.

Where are the farmers going to meet the \$200 mortgages on their Middle Western land due next year or thereafter? Where are the mechanics, who have been laid off, going to rustle the coin to pay those installments on thousands of \$4,000 homes they bought with a first payment on terms? Where are the factories employing those men going to sell their goods with loans unobtainable, and most farmers and cattlemen losing money every day? Retrenchment high sounding word, but the Japs still peddle the vegetables; the packers still make those enormous dividends; and county and city tax officials josh us by telling what a low rate we have when they have greatly raised amounts assessed.

It's time for us all to wake up, and the thing to do to establish general confidence and prosperity is to protect our production, making farming and livestock profitable, and the nation

will then prosper and meet its issues. Glve the farmer and the cowman, the sheep raiser, the hog man, the wheat grower and the cotton raiser a living profit, and make the business worth while, and our food, soil and clothes needs will take care of themselves. We are piling disaster upon disaster with our present policy of ruin. A little more of it and sad times will be upon this nation. Stop economic experiments and get down to fair prices for an honest day's work, and food in proportion.

Bread lines are bad. Idle men in these times, aggregated into millions, will coordinate and are as dangerous as T. N. T. The specter of starvation is still worse. Russia back to harharism, millions dying, all Europe in turmoil, production languishes, and this rich country temporizes with irritations. If we raise our products, make our food and meat supply safe, raise our leather and wool for our shoes and clothing, we will get along all right.

Gold merely represents commodities and in itself has no value. Gold is the fetish hung up to our worship, and though we have a hundred times its value unless we realize or are able to sell for gold we are declassed. As Baldus tells us the present condition doesn't come from the war. It started with watered stock many years ago, and the war was one result. Now the tail is wagging the dog. Those lanes and instruments designed to assist production, to make it easier to handle and save expense have become bloated dictators of finance and in their own importance far overshadow the very industries of production on which they exist.

Make farming and livestock profitable, and the rest will work out. Food will come down when supply reaches the limit set by demand, if it's not manipulated. The auto people can sell cars, the broker will find many customers and the retired farmers will make the cities prosper.

California Wins at Portland

By Jack Klein

ALIFORNIA was well represented in a number of breeds at the great Pacific International Livestock Exposition held in Portland recently. This was by far the largest livestock show ever held in the West with 11 acres under cover and over 4,000 animals crowded into the stalls and pens. The quality of the stock was wonderful and the classes usually numbered 10 to 40. Tenth place in a class of 30 is not so bad and when one gets a blue it is very gratifying. California was there strong with Shorthorns. The Pacheco Cattle Company of Hollister sent a number of its excellent young animals, a couple of firsts and a lot of others.

Little Sweetheart repeated her winnings of all other shows and was grand champion. Glide was generally in the money in the other classes also as was Wm. Bond and R. H. Parsons of Hilts, and the University of California won a blue.

In the milking Shorthorns T. T. Harrison, Chas. L. Weaver and J. D. Rowe furnished a good share of the show. Weaver's aged bull, North Star, was senior champion but Harrison's junior champion beat him for the grand championship. Rowe won all the honors in the female championships.

The Holsteins were a part of the 250 which gathered there and they more than held their own.

California Guernseys were represented by a single entry, Veda's May King of Edgemoor, which Winsor Ranch recently bought from Dupee. This wonderful young fellow was the wholeshow and repeated his record of the Los Angeles show. In the Ayrshires E. B. McFarland won eight firsts and junior champion bull.

The University of California made a wonderful record on its fat stock and won championships on its Shorthorn and Angus steers and the grand champ-

ion of the show. It also won grand champion wether of the show.

From the lengthy prize list we have culled the winnings made by the Californians and they are given below.

Shorthorns

Bull 2 and under 3, 13 in class: 4, Glide on Imp. Scottish Lord; 5, Pacheco Cattle Co. on Dalmeny Count; 8, Wm. Bond on Cumberland Closter.

Bull senior yearling, 10 in class: 6, Glide on Cheerful Count.

Bull junior yearling, 23 in class: 5, U. of C. on Memory's Champion.

Bull senior calf, 31 in class: 1, Pacheco on Pacheco Lad; 8, Glide on King's Count; 15, Parsons on Mountcrest Sultan.

Bull junior calf, 23 in class: 8, Parsons on Mountcrest Senator; 9, Bond on Cumberland Goods; 11, Pacheco on Pearl Pacheco.

Cow 2 and under 3, 16 in class: 3, Glide on Village Lassie; 7, Glide on King's Countess; 8, Bond on Amondale Maid 2nd.

Heifer senior yearling, 13 in class: 2, Pacheco on White Pacheco; 3, Glide on Village Rose; 9, Pacheco on Pacheco Bloom; 10, Bond on Cumberland Goldie; 11, Glide on King's Countess 2nd.

Heifer junior yearling, 25 in class: 2, Pacheco on Pacheco Doris; 7, Bond on Cumberland Maid; 10, Glide on Village Girl; 12, Bond on Cumberland Sunrise.

Heifer senior calf, 29 in class: 3, Pacheco on Sultan's Dale; 7, Glide on Hillcrest Flower 3rd.

Heifer junior calf, 35 in class: 1, U. of C. on Mary Ann Rush; 4, Pacheco on Pacheco Doris 2nd; 6, Pacheco on Pacheco Lass 213th; 9, Glide on Lady Sweetheart.

Cow and calf, 15 in class: 1, Glide on Little Sweetheart; 6, Parsons on Glosters Roseleaf. Senior and grand champion female Glide.

Aged herd, 9 entries: 2, Glide. Young herd, 10 entries: 3, Pacheco Cattle Co.; 7, Glide.

Calf herd, 20 entries: 1, Pacheco Cattle Co.

Produce of dam, 19 entries: 5, Pacheco Cattle Co.; 8, Glide; 10, Bond.

Get of sire, 20 entries: 5, Pacheco; 11, Parsons.

Milking Shorthorns

Aged bull, 5 in class: 1, Chas. L. Weaver, Tulare, on North Star.

Bull 1 and under 2, 7 entries: 1, Thos. Harrison, Santa Rosa, on Count Tuckford; 6, Harrison on Santa Rosa Type.

Bull under 1 year, 10 entries: 1, Harri-

son on Santa Rosa Pioneer; 2, J. D. Rowe & Sons on Dick; 4, Harrison on Santa Rosa Victor; 5, Weaver on Golden Star; 6, Rowe on Innisfall Trickster; 7, Weaver on Champion Royal; 9, Rowe on Innisfall Lad; 10, Harrison on Frantle's Pioneer.

Aged cow, 13 in class: 2, Harrison on Silver Lassie; 5, Harrison on Imp. Bessborough Curlew 2nd; 6, Harrison on King's Memory 19th; 8, Harrison on Naomi 2nd; 9, Harrison on Imp. Bessborough Lady 28; 10, Weaver on Idicwood 12th.

Cow 3 and under 5, 5 entries: 2, Weaver on Lucy Queen; 3, Harrison on Ramona Lee.

Cow 2 and under 3, 4 entries: 2, Weaver on Bonnie May; 3, Harrison on Welfare's Naomi.

Heifer senior yearling: 1, Harrison on Helarita Lee; 2, J. D. Rowe on Valley Bell 6th; 3, Harrison on Santa Rosa Queen.

Heifer junior yearling: 1, Rowe on Gipsy Girl.

Heifer senior calf: 1, Harrison on Lovey Perfection; 2, Harrison on Dolores Lee; 4, Harrison on Patsy Purdy; 5,

Baldwin on Anoakla Burke Cornucopia Walker.

Heifer senior yearling, 19 in class: 3, Baldwin on Anvacka Burke Cornucopia; 9, Geo. Jr. on Lady Dechuter Juliana.

Heifer junior yearling, 20 in class: 4, Baldwin on Burbank Aaggle Lincoln; 10, Baldwin on Anoakla Moorland Cream-elle.

Heifer junior calf, 39 in class: 9, Baldwin on Anoakla Princess Helena.

Aged herd, 11 entries: 5, Baldwin.

Produce of dam, 12 entries: 8, Baldwin.

Get of sire, 24 entries: 8, Baldwin.

Guernseys

One entry from California won first senior yearling, junior and grand champion. Veda's May King of Edgemoor shown by Winsor Ranch.

Ayrshires

E. B. McFarland of San Mateo won 8 firsts and junior champion bull.

CALVES BY CALIFORNIA SIRE SELL HIGH IN EAST

The following telegram has just been received from Edward Cebrian, manager of the Caledonia Farms, West Sacramento:

"In the Harding Shorthorn sale at Waukesha, Wisconsin, the average price was \$1,616. The calves sired by our bull, Imp. Caledonia, that were from nine to 12 months old, averaged \$2,470. All others, excluding the Caledonia calves, averaged \$1,515. A nine months old son of Caledonia sold for \$6,250."

Weaver on Sequel's Milkmaid; 6, Weaver on Brighton Lady.

Heifer junior calf: 1, Rowe on Buttercup's Beauty; 2, Weaver on Belle Star; 5, Harrison on Diana Lee 2nd; 6, Harrison on Betty Lee 2nd.

Senior champion bull, Weaver.

Junior grand champion bull, Harrison.

Junior, senior and grand champion cow, J. D. Rowe & Son.

Aged herd: 1, Rowe & Sons.

Young herd: 1, Rowe & Sons.

Calf herd: 1, Rowe & Sons; 3, Harrison.

Get of sire: 1, Rowe & Sons; 2, Harrison.

Produce of dam: 1, Harrison; 2, Rowe & Sons; 3, Weaver; 4, Harrison.

Holsteins

Aged bull, 12 in class: 2, Anita M. Baldwin on Mercl Lad Korndyke Burke; 4, Geo. Jr. Republic on Dichter Spofford Korndyke Lad 5.

Bull 2 and under 3, 10 in class: 5, Stalder on Rosamaines Pontiac Ormsby.

Bull senior yearling: 1, Higdon on Prince Bonnie Walker.

Bull senior calf, 19 in class: 9, Baldwin on Prince Walker Cornucopia 19th.

Bull junior calf, 18 in class: 8, Higdon on King Korndyke Leda Pontiac; 9, Stalder on Nueva Colantha Ormsby.

Aged cow, 26 in class: 5, Burr Farm on Amella Bona De Kol; 9, Burr Farm on Bess Creole Belle 3rd.

FEEDING THE DAIRY COW

Too many cows are underfed. A cow weighing 1,000 pounds needs each day, for the maintenance of her body, an amount of food equivalent to that supplied in eight pounds of alfalfa hay and 20 pounds of good corn silage. She must have this food regardless of whether she produces any milk. Food used for milk production must be in addition to that required to keep the cow's body. A 1,000 pound cow producing 20 pounds of four per cent milk a day, if properly fed, devotes about half of her feed to maintenance and half to milk production. Obviously, when a dairyman has gone to the expense of supplying that half of the food required for maintaining the cow's body, it is poor economy to withhold any of the other half, all of which goes to produce milk. A cow then requires feed in accordance to the amount of milk she is able to produce. The heavy producer needs the most feed.

Farm grown roughages (silage, hay, etc.) furnish the cheapest food nutrients. However, a good dairy cow cannot eat enough roughage to supply her needs for milk production. She must have some grain. Therefore, to feed with the most economy the following rules must be observed, says the Missouri college of agriculture.

Feed all the roughage a cow will eat. She will eat more if fed three times a day instead of twice.

Feed grain in proportion to the pounds of milk produced.

To a Jersey or Guernsey cow feed one pound of grain for each three to 3½ pounds of milk produced.

To a Holstein, Ayrshire or Shorthorn feed one pound of grain for each four to 4½ pounds of milk produced.

Reports from Arizona indicate that the cotton farmers of the Phoenix district will be heavy buyers for California dairy cows during the coming winter, and estimates as to the number required run into the thousands. During the last few years hundreds of dairymen turned from dairying to cotton and now, with financial ruin staring them in the face, they look to the dairy cow to pull them out.

Own Champion Duroc-Jerseys

Heading the great Diamond Bar herd of Duroc-Jerseys is the famous sire, Ace of Pathfinders, Grand Champion boar at the Los Angeles Livestock Show, 1919, and head of the World's Champion Aged Herd at the National Swine Show, 1919.

His pigs have made phenomenal records, winning an extensive list of "Firsts" at all the large California stock shows.

In short, the Diamond Bar herd with its 1,200 head of pure bred Duroc-Jerseys, has set a new standard for the hog breeding industry of the West.

For greater pork production and breeding profit, build up your herd with this blood.

Place your order this week for registered bred sows and gilts and registered herd boars, sired by the Ace of Pathfinders and our other renowned sires.

SPECIAL

Unregistered purebred gilts in carload lots or less, \$35 a head. We guarantee every animal sold to be exactly as represented.

Act promptly.

More to It Than Good Feeding

MILK-PRODUCTION records are not the result of good feeding alone. Fact is, the very process of "forcing" a cow to maximum milk-giving is full of grave dangers to her health unless the milk-making organs are assisted in the rebuilding process.

While primarily a medicine for treating sick cows, the recognized tonic and strengthening effect of Kow-Kare on the organs of production, have caused it to be widely used as a preventive of disorders such as are common to cows.

When disorders do arise—such as Abortion, Barrenness, Retained Afterbirth, Scouring, Lost Appetite, Bunches, you'll find Kow-Kare a reliable, prompt remedy. Its action on the digestive and genital organs is restorative and strengthening.

Kow-Kare is sold by feed dealers, general stores and druggists; 70c and \$1.40 packages. Write us for our valuable free book "The Home Cow Doctor."

DAIRY ASSOCIATION CO.
LYNDONVILLE, VT.

NOTE: The trade-mark name has been changed from KOW-KURE to KOW-KARE—a name more expressive of BOTH the PREVENTIVE and CURATIVE qualities of the remedy.

Finnell Herefords in Snappy Sale

Notwithstanding a bad day and muddy roads, the 63 head of Hereford cattle offered by the Finnell Stock Farm, Galt, November 18, were readily absorbed by one of the smallest crowds that has attended a recent sale, and the values that were established were entirely satisfactory to all concerned. The average price paid was \$240. The cattle were presented in splendid condition. But few had ever been handled at the halter, consequently they were put through the ring loose.

The fact that this was the fourth Hereford sale to be held this fall is strong evidence of the strength of the demand for Hereford cattle in California. As with former sales, the event served to start new men in the business, a remarkable feature of the sale being that nearly the entire offering was divided between two new buyers. I. L. Borden, extensive land owner and a member of the state board of agriculture, was the heaviest buyer and secured 32 lots. G. F. Silliman of Watsonville laid the foundation for a new herd by the purchase of 20 females. Other buyers at the sale were: Geo. P. Robinson, Sacramento; Welty Bros., Vernalis, and Lafe Ward, Galt.

The sale was managed by C. L. Hughes of the California Breeders Sales and Pedigree Company, Sacramento. Ben A. Rhoades of Los Angeles was the auctioneer and he was assisted by John A. Davis of Manteca.

A complete list of sales follows:

1. Being, April, 1914; Geo. P. Robinson, Sacramento, \$250.
2. Bevey, June, 1914, I. L. Borden, San Francisco, \$245.

61. Extra, G. F. Silliman, \$215.
62. Extra, (bull), Geo. P. Robinson, \$150.

U. C. MAKES A GREAT RECORD AT PORTLAND

The department of animal husbandry at the University of California made an enviable record at the tenth annual Pacific International Livestock Exposition at Portland, exhibiting the grand champion and reserve grand champion steer and grand champion wether at this show, in addition winning nine first prizes and four second prizes.

U. C. Jock 4th was grand champion steer of the show. As a calf, in 1919, he won first at the California International Livestock Show, was champion Angus steer at the same show and later was first prize calf and reserve champion Angus at the International at Chicago.

California Majestic was reserve grand champion at the Pacific International Livestock Exposition, and in 1919 he was first prize Shorthorn calf at the California International, and champion Shorthorn steer and reserve champion steer at the same show. At the International in Chicago in 1919 he was first prize Shorthorn calf and reserve champion Shorthorn.

Mary Ann Rush was first prize junior heifer Shorthorn calf at the 1920 Pacific International at Portland. This heifer was dropped April 1, 1920. She was sired by Champion Junior 3d and out of Moon Beam 8th, and was presented to the university by Senator Benj. F. Rush of Suisun.

Memory's Champion won fifth prize as the young yearling Shorthorn bull at the Pacific International this year, and in 1919 was first prize junior calf and reserve junior champion at the 1919 Los Angeles Livestock Show, and first prize junior bull calf at the California International in 1919.

In the hog classes the university won first and second on Duroc-Jersey singles and first and second on pen of Duroc-Jerseys. The first prize pen was a uniform lot of under-year hawks that weighed 500 pounds. The second prize pen were under six months barrows. In the Berkshire classes the first prize barrow was a deep bodied thick under year barrow, and was one of the first prize pen of Berkshires in the show. Two Hampshire barrows were shown and stood first and second respectively in the Hampshire classes.

Owing to the impossibility of taking to the exposition more than one carload of livestock of all classes, only three sheep were shown. Three yearling wethers, two of them Southdowns and the third a grade Shropshire, walked away with the grand championship in the fat sheep classes and won first, second, third and pen. The showing was made more creditable by the fact that two of these three wethers were fitted as lambs and won their respective classes at the 1919 International Livestock Exposition at Chicago.

Much credit is due to the untiring energy and ability of Alex McDonald, George Philip and Ralph Dunham, the men who fed and fitted these animals.

ILLS OF THE YOUNG CALF

Success in dairy farming depends to a great extent upon the careful rearing of the calves. Carelessness in breeding and calf raising is bound to result disastrously to a herd or at least keep it at a standstill, as far as improvement is concerned. Without raising calves from which to replace discarded animals it is almost impossible to raise the average production of the herd. Purchasing cows for this purpose is a very unsatisfactory method. Cows placed on the market are almost certain to be of very ordinary grade since a good cow whose value as a milk producer is known is not

offered for sale at market price. Therefore the dairy farmer should take every precaution in handling the young calves which are to be placed in the herd.

Even though a young calf establishes respiration and gets its first meal without difficulty, it is still subject to many ills, chief of which are digestive disorders of some kind. These troubles are likely to be more numerous among calves that are weaned while young and fed from pails. Indigestion, or scours, as it is generally known, is the most common trouble in raising calves by hand. The chief causes of this trouble are: Over-feeding, feeding cold milk, old or sour milk, and the use of dirty pails, troughs or stalls. By keeping the conditions right all the time these troubles might be avoided. Each calf should be watched closely for signs of indigestion. Foul smelling dung is often the first sign of the trouble. When such indications are present the ration should be cut down to one-half the usual amount. When a severe case of scours is noticed the feed should be reduced and the calf given two or three ounces of castor oil in one pint of milk. For a few days following this treatment it is well to add one teaspoon per pint of milk fed of a mixture of one-half ounce of formaldehyde in 15½ ounces of water.

White scours, or calf cholera, is quite common with calves. This is a violent and deadly form of diarrhoea. It may appear immediately after birth and is likely to show itself the first or second day. The calf is very sick from the beginning; the eyes are sunken, the belly retracted, the breathing short and rapid, the temperature very low and the calf soon becomes unconscious. The discharge from the bowels is rather profuse, of a white color and very offensive odor. As a rule the calf dies within 24 to 36 hours. This is a contagious disease which gains access to the calf's body through the navel soon after birth. An animal once affected rarely recovers. There seems to be no treatment, therefore we must rely upon prevention. The trouble may be avoided by making sure that the calf is dropped in a clean stall and that it is not allowed to come in contact with dirt or manure until the cord is dry. If the herd is on pasture it is best to allow the cow to remain there until the calf is born. Infection is not likely to occur in the pasture. If the calf is dropped in the barn the surroundings should be free from filth.

Occasionally young calves suffer from constipation, notwithstanding the purgative effects of the colostrum or first milk. This may be due to unthrifty cows or the feeding of dry innutritious feeds during the later periods of pregnancy. Whatever the cause, if the calf is costive, showing signs as in colic and failing in appetite, no time should be lost in giving relief. First remove the cause if it can be located. To stimulate the bowels administer one to two ounces of castor oil.

"LUMPY JAW"

Actinomycosis, commonly known as "lumpy jaw" or "wooden tongue," occurs quite frequently in cattle and is sometimes found in horses, swine and man. The condition is produced by a fungus which causes an inflammatory reaction in the tissues, characteristic of the disease. At first there is produced a dense tissue with a characteristic breaking down of the infected area and formation of pus. Such changes at times produce very serious injury to important structures.

Observations have demonstrated that the infection is carried to the parts invaded by beads of grain which contain the fungus, penetrating the tissues. The disease is most frequently found affecting the head and neck but other parts may become affected through abrasions. In the early stages the tumor like formation is rather firm and not very sensitive to pressure. The growth gradually continues to enlarge until all the surrounding parts are involved. After a time the dense tissue becomes soft in places and abscesses are noted. When the pus from these abscesses is examined it will be found to contain small granules resembling sulphur. When examined microscopically they are found to be clumps of the fungi causing the disease. The abscesses

may form to a considerable size and after the disease has existed for some time formations of exuberant tissue (known as proud flesh) may be found in the pus cavities and around their openings. When the fungus invades the jaw the bone may become affected and deformed considerably. The affected portion of the bone when examined after death presents the appearance of a honeycomb.

Actinomycosis of the tongue renders it difficult for the animal to manipulate this organ owing to the chronic inflammatory processes. The common term for this condition is "wooden tongue." The jaw and the tongue are the most common seats of the disease; it is not unusual, however, to find the throat, salivary glands and other parts involved.

The treatment of lumpy jaw at times requires surgical procedure together with medicinal treatment, while at other times, in the early stages of the disease, medicinal treatment alone will effect a cure. Potassium iodide is very effective in treatment of this disease. Advice from a veterinarian

regarding medicinal or surgical treatment of this affection is advisable.

The meat of an animal other than the parts affected may be eaten without danger to the consumer, provided the carcass is in good condition otherwise. In the way of prevention, it is well to feed bearded cereals finely ground. Feeding hay that contains foxtail may produce the disease.—S. O. T.

FORTIFY AGAINST ANIMAL DISEASES

Just recently we experienced a concrete example of what preparedness means when confronted with war. The division of animal industry advises that the same is true with persons who engage in the raising of livestock. The health of the animals must be fortified against the ravages of diseases.

Here are some of the essential factors which assure a reasonable amount of safety:

Barnyards and pens should be well drained and kept clean.

All covered buildings in which animals are housed require good ventilation and drainage. Concrete floors improve considerably the sanitary conditions.

Animals, like people, require a certain amount of exercise, and provision should be made to supply it.

Extreme precaution should be taken to prevent animals from coming in contact with diseased or exposed animals.

It is an enjoyable, if not a profitable, pastime to the owner to exhibit his best animals at fairs and shows, but when they are returned to the farm, as well as others that may have been purchased, they should be segregated for a period that will insure their freedom from contagious diseases to which they may have been exposed.

Periodic disinfection of yards, pens, and buildings should be resorted to whether or not contagious diseases have existed on the premises.

Such procedure, together with careful selections of rations, will as a rule produce gratifying results.—S. O. T.

At Public Auction Thursday, December 16

State Fair Grounds, Sacramento, Cal.

The sale list contains some of the most highly bred and highest record cows and heifers offered in California this year, and carrying the services of some of the foremost bulls in the state.

In the offering the entire herds of R. F. Fisher, Carlotta, and J. McKindley, Acampo, will be dispersed, the balance of the sale being made up of consignments from five leading breeders.

THE LIST OF FEMALES INCLUDES:

A 1,038 POUND YEARLY RECORD GRANDDAUGHTER OF KING OF THE PONTIACS, out of a daughter of King Hengerveld that was junior champion at 1911 California State Fair. This record was recently completed, and she will freshen again before sale as a 7 year old.

FOUR DAUGHTERS OF THE ABOVE COW, including a junior 4 year old sired by a son of De Kol of Valley Mead, on yearly test with 650.87 lbs. butter to her credit in 298 days. TWO DAUGHTERS AND ONE SON of the above mentioned 4 year old.

A GRANDDAUGHTER OF KING OF THE PONTIACS, with 764.86 lbs. butter from 19,040.3 lbs. milk in 305 days. She is due to freshen again in January.

THREE DAUGHTERS AND ONE SON of the above cow, one of a 25.56 lb. junior 3 year old with 424.53 lbs. butter from 10,283.3 lbs. milk in 148 days.

A 32 POUND GRANDDAUGHTER OF COLANTHA JOHANNA LAD, heavy with calf to the three times Grand Champion bull Segis Alcartra Prilly.

A 27.87 POUND 3 YEAR OLD daughter of the great 28 lb. cow Locust Terrace Gold Drop, and sired by Prince Gelsche Walker Korndyke, the \$4,000.00 son of Prince Gelsche Walker. She is due in January to King Segis Alcartra Prilly.

A 23 POUND 3 YEAR OLD daughter of Sir Rag Apple Korndyke, out of a 26 lb. 4 year old granddaughter of De Kol 2nd's Butter Boy 3d, heavy with calf to King Segis Alcartra Prilly.

A 2 YEAR OLD DAUGHTER OF KING SEGIS ALCARTRA ABBEKERK, due with first calf in January to a 35 lb. yearly record son of King Segis Alcartra Prilly.

TWO 21 POUND DAUGHTERS AND ONE 21 POUND GRANDDAUGHTER of Tidy Abbecker Prince, all of them bred to Sir Aaggie De Kol Acme, son of the world's official yearly butter record cow Aaggie Acme of Riverside 2nd.

A DAUGHTER OF THE TWICE 34 POUND COW GERBEN ABBEKERK MAID, with 25.77 lbs. butter in 7 days as a 3 year old. She will be fresh before sale.

A 23 POUND DAUGHTER OF CHANGELING BUTTER BOY, out of a 26 lb. daughter of a 26 lb. cow. Bred to a son of Sir Aaggie De Kol Acme.

A DAUGHTER OF SEGIS PONTIAC DE KOL BURKE, out of a 26 lb. 3 year old daughter of King Mead of Riverside that made 644 lbs. butter in one year as a 2 year old. Bred to a son of Sir Aaggie De Kol Acme.

A GRANDDAUGHTER OF ARLA DE KOL, out of a 768.29 lb. yearly record daughter of a 1,025 lb. yearly record cow, whose dam in turn made 1,008 lbs. butter in one year. Bred to a son of Sir Aaggie De Kol Acme.

There will be only a few bulls in this sale, but they are such as should attract dairymen who want bulls of substantial breeding, and besides the two youngsters in the big group in the Fisher herd, already referred to, include

A SON OF PRINCE GELSCHER WALKER, out of a 20 lb. 4 year old granddaughter of Aralla De Kol, second dam a 21 lb. 4 year old granddaughter of King of the Pontiacs, third dam the 1,008 lb. yearly record cow Miss Blaney.

DON'T MISS THE MANY BARGAINS THAT ARE SURE TO RESULT IN THIS SALE! THINK OF THE SPLENDIDLY BRED YEARLINGS AND HEIFER CALVES!

THINK OF THE WONDERFULLY BRED CALVES THE FEMALES IN THIS SALE WILL DROP TO THE SERVICES THEY NOW CARRY!

LIVESTOCK SALE CALENDAR

Holsteins
December 16-17, Consignment Sale, Sacramento.

Poland Chinas
February 17, Bassett, Ross & Crawshaw, Hanford.

Berkshires
February, Italian Vineyard Co., Guast.

Durocs
February, Falfadale Farm, Perris.

Percheron Horses
February 17, M. Bassett, Hanford.

Sundrie Sunbeam Girl, the great Holstein cow of the Santa Anita Rancho, who started this year's test by dropping triplet calves, has finished her work with 29,533.6 pounds of milk and 1,124.3 pounds of butter. This fine record was made at nine years of age. Marken Louise has increased her seven day record to 607.3 pounds of milk and 35.55 pounds of butter, and the three year old, Anoakia Gelsche Pontiac Walker, has increased her seven days to 27.75 pounds and her 30 days to 113 pounds.

Hollow Hill Farm, which is reducing the size of its herd of Guernseys, has sold to W. E. Bush of Covina the cow, Grace of Neshannock, who has a four year old record of 485 pounds butterfat, also Della Lang-

don of Hollow Hill Farm, who was first senior yearling at the state fair and at Phoenix, and Violet Langdon of Hollow Hill Farm, another excellent daughter of King of Hollow Hill. Mr. Bush, who is establishing a small private dairy, also bought a bull calf by Effie's King out of Imp. Brittleware Mistletoe, the great cow whose showing and production records have kept in the limelight for years. Her record of 751 pounds butterfat as a four year old was one of the highest in the United States when made. This young bull is richly bred and his two nearest dams average 15,017 pounds milk and 743 pounds butterfat as four year olds. Hollow Hill Farm also sold to Alfred Peterson of El Centro a young bull out of Capelle's Jessie, who has a three year old record of 556 pounds of fat.

Alex Willson of the Italian Vineyard has chosen February 1 as the date for his sale of bred Berkshire sows and gilts. His offering will be a choice one, being the tops of the Italian Vineyard herd combined with the tops of the herd purchased recently from the Sandercock Land Company.

Dr. E. Avery Newton, owner of the Arenal Ranch at Lankershim, has sold to the university farm a spring Hampshire boar sired by Admiral Tipton and out of Parole Lady. This pig was

a winner in the shows and was chosen by Prof. Hughes after he had judged him a number of times.

Frank Foster of Clements has purchased from Caledonia Farms, West Sacramento, two young Shorthorn bulls sired by Spicy Champion 2d and out of well bred dams.

Little Sweetheart, the remarkable Shorthorn cow owned by Thornton S. Glide, Davis, was again grand champion at the Portland show. In ten of the leading shows of America during the last two years Little Sweetheart has met defeat but once.

Reference was made recently to the new world's milk record being established by the Holstein cow, Carnation Segis Pietertje Prospect, owned by the Carnation Stock Farms of Seattle, Washington. In 318 days she produced 33,499 pounds of milk and it is expected that she will average over 100 pounds per day for the entire year. She is a daughter of King Segis 10th and her dam is Beauty Pietertje Clothilde, a daughter of Beauty Pietertje Prince. Her dam is therefore a half sister to Prince Gelsche Walker.

The Holstein cow, Pabst Virginia Johanna, owned by Fred Pabst of Wisconsin, has just established a new world's record in the ten months di-

vision by producing 744 pounds of butter from 15,340.5 pounds of milk in 298 days.

Toyon Farms, San Francisco; A. W. Morris and Sons, Woodland, and the Bridgford Holstein Company, Patterson, expect to contribute consignments to the Brentwood sale to be held at Philadelphia the last three days in March.

Fifteen farmers in the vicinity of Wendell, Idaho, plan to import 30 head of Guernsey cows direct from the Island of Guernsey.

Andy Simpson, in charge of the Caledonia Shorthorns, is preparing ten heifers, most of them carrying the service of Imp. Caledonia, for the American Shorthorn Congress sale to be held at Chicago in the spring.

J. B. Newsome of the California state department of agriculture has announced that brand inspectors have been instructed to refuse to inspect cattle for marks and brands when such cattle are loaded in cars prior to inspection. All inspectors have been told to notify railroad agents that inspections must be made in the loading corrals and that no certificates will be issued unless inspection has thus been complied with.

Guy H. Miller of Modesto recently sold to Hugh F. Richards of Denair the Jersey bull calf Almonoll Jap Owl, sired by his senior herd sire, Jap's Perfection Owl, and out of the great cow, Pearl of Venadera, Register of Merit test 702 pounds of butterfat in a year. Mr. Richards is founding an excellent herd of pure bred Jerseys at Denair, having secured a number of high class females from the Jersey Queen Farm at San Jose. Another sale by Mr. Miller was to H. H. Wallis of Crows Landing, the yearling Jersey heifer, Sapphire of Venadera, a full sister to the bull calf sold to Mr. Richards. This is a promising helper of the best breeding in producing line. She should make a great cow. Mr. Wallis has been dairying with a herd of high grade Holsteins for some years but has recently decided to try pure bred Jerseys.

Kern County is coming to the front with pure blood Holsteins-Friesian cattle. J. L. Sebastian of Wasco has on test Zamva Aurelia Segis Pontiac, a very promising three year old. The first seven days after freshening she gave 25.23 pounds butter from 542 pounds milk. The second week under official test she gave 24½ pounds butter from 623½ pounds milk. Some interesting figures are looked for at the close of 30 days.

Owing to weather conditions the sale of Poland China hogs scheduled by Marshall & Son, Sebastopol, for November 15 had to be called off. Just at present the firm is undecided when they will be able to sell. Meanwhile they are breeding most of their females to their good boar, Headlight, reserve grand champion at Sacramento, and may possibly announce their sale for some time after the first of the year.

Santa Anita Rancho has sold the young bull, Prince Walker Cornucopia 22d, who is out of the 22 pound three year old, Anoakia Lyons Butter Boy, to Ernest Lordo of Camarillo, Mexico.

WHAT ARE VITAMINES?

Vitamines have been classified into three different types, depending upon the functions which they have in promoting well being and growth. The first type is known as water soluble vitamins, and these are necessary in order to obtain growth from food. Lack of these causes beri-beri, which manifests itself by disease of the nervous system and by other symptoms. These vitamins are found in seeds, in green plants, in certain bulbs and fleshy roots and fruits, and in milk and eggs, as well as in certain organs in the animal body. The seeds referred to include beans, nuts and the various cereal grains. When cereals are very highly milled in order to obtain a very fine white flour, a large part of the vitamins may be removed. Vitamins are also lost when rice is polished in order to remove the outer layers which contain most of the vitamins. It is

International 8-16 The Adaptable Farm Power

ON sun-baked slopes, in rain-soaked valleys, on rolling uplands and level plains—everywhere you will find **International 8-16 Kerosene Tractors** working efficiently, converting cheap kerosene into valuable farm power.

Plowing, disking, seeding, cultivating orchards, hauling heavy loads on road and farm, pulling stumps, dragging roads, drawing mowers, hay loaders, grain harvesting machines; threshing grain, baling hay, cutting ensilage, sawing wood—on all heavy farm tasks where dependable power is required either at the drawbar or belt pulley **International 8-16 Kerosene Tractors** are rendering satisfactory, year-'round service.

The **International 8-16**, because of its light weight, snug compactness, ease of control, generous reserve power above its rating for emergency pulls, three speeds forward, economical operation and general fitness for diversified service, is highly popular with farmers in every branch of agriculture.

Fifteen years of tractor building experience and over three-quarters of a century of general farm machine success, backed by a broad-as-agriculture reputation for fair dealing, good quality and dependable after-sale service—these factors are your assurance of satisfaction when you buy an **International 8-16 Kerosene Tractor**.

for this reason that a diet consisting mainly of polished rice may cause beri-beri, while unpolished rice does not cause this disease.

The second type is known as fat soluble vitamins, and these are found in butter, eggs, milk, and in certain animal organs such as the heart, kidneys and liver, and to some extent in other fats as well as in green vegetables. They also exist in smaller quantities in certain seeds. When fat soluble vitamins are absent from the diet animals and man are subject to a disease of the eyes, which appears to be related to xerophthalmia and which, if prolonged, may produce blindness.

The third type is known as anti-scorbutic vitamins, that is, those which prevent scurvy, which manifests itself by disease of the bones as well as in other ways. These vitamins are found in oranges, grapefruit, lemons and other citrus fruits, and in green vegetables such as tomatoes, spinach and lettuce, and in eggs and raw milk. The drying of vegetables frequently destroys the activity of the anti-scorbutic vitamins. The best source of vitamins is in the leafy parts of vegetables, and this is one of the reasons why spinach, lettuce and cabbage are valuable foods.

THREE YEARS PROFITS LOST BY NOT TESTING COWS EARLIER

The following letter is typical of the experience of the average pure bred breeder of dairy cattle who starts testing in his herd. C. M. Walbridge, a Jersey breeder of Missouri, started testing last December. Already he has found the work extremely valuable. If you have a number of pure bred cows freshening this fall, start them on test as they freshen. Read what Mr. Walbridge says.

"Nine years ago I purchased one grade Jersey cow and have gradually worked up to 12 registered females and have Majesty's Oxford Financier as my herd sire. In seeking purchasers for my bull calves I was repeatedly asked for the records of their dams and the dams of their sires. My private records were not as exact as they should have been and I found each year more buyers were asking for official Register of Merit records. Last December we started official Registry of Merit test and have developed facts that have been most valuable to us. One large promising young cow that we thought was a bread winner proved a joke. She milked fairly well for 90 days with a good butterfat test, but gradually dwindled down to almost nothing. Another cow that was, and had been, a consistent milker for us and one that we raised showed a marked lack of butterfat for a Jersey. They are both out of our herd now. We started a junior two year old on test April 25. She has been in the 50 pound class now for five months and stood fifth in rank of junior two year olds for June. We would never have known what we had in this heifer unless we had had her on Register of Merit test. You can readily see what her record will do to the value of her handsome bull calf sired by a bull that took the blue ribbons in four different states.

"We find ourselves studying balanced feeding and individual attention to our cows on Register of Merit test to a much greater degree than we ever have before, at the same time only according them good farm care. I feel that I have lost three years by not taking up this work three years sooner, which I could have done just as well as this year and could have eliminated several head that never would make good. I now feel that every cow on my place must be a Register of Merit cow and make that showing for me with an opportunity to beat her own record."

Life of cotton duck, used for protecting farm machinery, sacked grain, market fruits, field crops, etc., may be prolonged and the cloth made more serviceable by simple methods of water proofing and mildew proofing worked out by the United States department of agriculture.

Several California breeders of beef cattle made long winnings at the recent Portland show.

RATIONS FOR DRAFT HORSES, BROOD MARES AND COLTS

Experimental and demonstration work by the Missouri college of agriculture shows:

That draft horses averaging in weight approximately 1,600 pounds and which did 4.8 hours a day average farm work required an average daily ration of 14.91 pounds of grain and 17.12 pounds of timothy hay.

That brood mares may be used efficiently for farm work, but the yearly feed required by them is 26 per cent greater than the cost of feed required by gelding or "dry" mares doing the same work.

That brood mares working and nursing foals required 47 per cent more grain and 32 per cent more hay daily during the suckling period than dry mares.

That foals during the suckling period consumed an average daily ration of 3.58 pounds of grain and 1.35 pounds of hay, in addition to their mothers' milk.

That draft colts consumed an average daily ration of 6.68 pounds grain, 7.42 pounds hay daily, from weaning time until they were turned in pasture in the spring, a period of 219 days, during which time they gained 330 pounds and weighed at the close of the period 836 pounds.

That it required 4.40 pounds of grain and 4.83 pounds of hay to produce one pound gain on draft colts from weaning time until turned on pasture the next spring.

That 15 pounds of corn silage, eight pounds oat straw, fed with eight pounds grain, is a satisfactory ration for horses doing light work during the winter months.

TALKING OF PRICES!

Here is one reported to the United States department of agriculture:

A man bought a mink-lined overcoat for \$500 in 1915. Two years later he sold the mink lining for \$1,000 and

replaced it with nutria for \$150. He wore it two years and sold the nutria lining for \$250, putting in a muskrat lining that cost \$55. In 1919 he sold this lining for \$300, and still has the shell and \$845 clear profit.

TREAT YOUR OWN LIVE STOCK PROMPT FIRST AID IS VERY IMPORTANT

You never know when an animal is going to be sick, or some accident occur, requiring quick action to prevent loss or permanent injury. If you know what to do and have the necessary medicines on hand you can save a valuable animal that otherwise may be lost.

There is a Dr. David Roberts Prescription for Every Animal Ailment

Study the *Practical Home Veterinarian*. Get our medicines of your local druggist. You can successfully treat Calf Cholera, Constipation, Abortion, Udder Troubles, Colic and dozens of other ailments common to livestock. If no dealer near you, write us direct. Veterinary advice free. Ask for free copy of the "Cattle Specialist" with full information pertaining to abortion in cows. Tells how to treat your own herd at small expense.

Is Your Herd Linked Up With the Big Yearly Producers?

The yearly test for milk and butterfat production as worked out in our herd has gradually resulted in making this a herd of descendants of a few clearly defined families of outstanding producers and reproducers.

King Korndyke Pontiac Acme

To produce this bull we made one of the strongest matings possible to make at that time in our herd, by breeding Miss Aaggie Acme Burke to King Korndyke Pontiac 20th, the latter owned by Mr. W. J. Higdon at the time the mating was made.

The sire, KING KORNDYKE PONTIAC 20TH, who sold for \$6,500 as a calf and later sold to Burr Farm, Los Angeles, for \$12,000 is almost too well known to require description here.

The dam, MISS AAGGIE ACME BURKE, with the world's record in class of 24,338.8 lbs. milk in one year as a first calf junior 2 year old, and with 1,034.44 lbs. butter in one year, which is third highest in class, ranks as the greatest heifer of milking age that we have yet produced.

We owned and developed all of the seven nearest dams of this bull, the seven, including the 2 year old record of the dam, averaging 1,058.16 lbs. butter and 22,775.2 lbs. milk in one year.

We also owned six of the seven nearest sires of this bull, and developed most of their daughters that have freshened to date.

With this first hand knowledge of thirteen of his fourteen nearest ancestors, the fourteenth being King of the Pontiacs, we have the utmost confidence in his ability as a sire, and consider that the rare mating which produced him more than justified the \$41,000.00 price which he commanded at the St. Paul National Sale.

He is now at the head of the splendid herd owned by

ANITA M. BALDWIN

Santa Anita Rancho

Santa Anita, Cal.

In this series of announcements, which will appear every other week in the CULTIVATOR, we will feature each time a sire heading some breeding or dairy herd, that links that herd up closely with our greatest producing families.

To summarize at the beginning a few facts in relation to the tremendous dairy production which these families have demonstrated through the yearly test, we submit the following data:

**149 Yearly Records in This Herd Show
a Total Production of 2,605,217.1
Pounds Milk, and 113,129.28
Pounds Butter**

8 records average over 1,200 pounds butter in one year.

20 records average 1,149.33 pounds butter in one year.

38 records average 1,002.25 pounds butter in one year.

73 records average 901.04 pounds butter in one year.

123 records average 802.99 pounds butter in one year.

The entire 149 records average 759.25 pounds butter and 17,464.5 pounds milk in one year.

Included in the 149 records are 52 records made by 2 year old heifers with first calf, the 52 averaging 639.97 pounds butter in one year.

Naturally the matings in our herd at present show the greatest combinations of these great proven producing families, and every indication leads us to expect a continuation and even an increase of production in the blending of these families.

Is your herd linked up with such production as this through your herd sire?

We price our bulls reasonably, from the highest class sires to head registered breeding herds, down to well bred bulls to head grade dairy herds. Write us your needs, we may have just the bull to fit your herd.

A. W. Morris & Sons Corporation Woodland, California

NEVADA HEREFORD RANCH

We always carry a large herd of high-class Herefords and at the present time we are offering:

A splendid lot of young cows with Harris Standard 2nd calves at foot, and many of them rebred.

A nice selection of young cows and heifers bred to our herd bulls.

A choice collection of open heifers.

A lot of good rugged range bulls. These are the real money making kind, and they are priced to make money for the buyers. We will sell them in car lots or in lots to suit buyers.

We also have some choice young bulls of herd-header caliber that we will sell well worth the money.

We invite your inspection.

John H. Cazier & Sons Co.

SHEEP LICE

By E. R. de Ong

Small outbreaks of sheep lice in Solano and Yolo Counties have occurred during the last two years, 1919 and 1920. These are new insects to many of our stockmen, but something which should be guarded against. Lice have been reported from Solano County since 1912, but from the frequency of recent attacks it would seem that they are on the increase. Two distinct species have been recorded, one a biting louse, light amber in color, much resembling the common body louse of the chicken. This louse is usually found on the body, in the wool. The second species is more like the blue cattle louse, of a distinct bluish color. This is a sucking louse, feeding on the blood of the host. They are found mostly on the hairy part of the leg from the point of the shoulder blade down to the hoof.

There has been no opportunity as yet of dipping sheep for the biting lice on the body, nor do we know how severe an attack may be. The sucking lice have been found very abundant on one flock. Two young rams which were very heavily infested died, apparently from the attack. The flock has been dipped twice with Kresol, 1 to 70. The first treatment was almost a failure as the alkaline water broke the dip, but by softening the water with one pound of lye to 100 gallons of water a good solution was secured for the second treatment, which has proven quite successful. As yet the life history of the louse is not known well enough to state positively how many dippings are necessary to eradicate it, and how often. This is something which it is hoped the experiment station may work out in the near future.

HORSE COST LESS THAN COMMONLY SUPPOSED

In the exact cost accounting studies carried out by the bureau of farm management of the University of Illinois, covering a period of five years, work horses required annually but 25.3 bushels of corn, 37.8 bushels of oats, 1.7 tons hay and 170 days access to pasture, at 1.96 acres of pasture per horse. This is an allowance of 2,626.4 pounds of grain, 3,400 pounds of hay and 1.96 acres of pasture per year for each working horse. The horses observed were working regularly on Illinois farms under usual farm conditions.

With these figures as a guide it is not difficult to compute the cost per horse per year. Manure produced by horses and colts is valuable to the farmer and offsets feeding costs at present grain prices to the extent of approximately \$39 per year for a drafter and \$30 per year for a draft colt. This is placing its worth at \$3 per ton. At present, figuring corn at 90 cents, oats at 60 cents, hay at \$25 per ton and \$15 per acre for pasture rent, the total board bill for a working horse comes to \$117.35 per year. The farmer subtracts from this the value of fertilizer contributed, \$39, leaving but \$78.35 expense for a year's feeding.

These exact figures explode the high cost of feeding theory. The recent drop in hay and grain prices is also an economy argument for city users of draft and wagon horses. Nor has it disturbed the balance between cost of production and income on farms where horses and mules are used, for with the decline of feedings stuffs the cost of maintaining farm power likewise drops.

THE FIRST JERSEY CALF CLUB

The Stanislaus Jersey Calf Club has been organized by the Stanislaus Jersey Breeders Association ably assisted by Prof. O. P. Palestine, agricultural instructor in Modesto high school. The members of this calf club are 12 boys and three girls as follows: Marguerite Conant, Barbara Campbell, Jewel Campbell, Jordan Campbell, Elmo High, Dwight Hackett, Jesse Henry, Max Henry, Clifford Daniel, Vernon Hayworth, Ervin Hayworth, Clifford Lanterman, Herbert Lanterman, Cecil Lambert, S. Leigh Howard.

The committees of Jersey breeders in charge of the work secured the consent of the Modesto Bank, the California National Bank of Modesto and the Sacramento San Joaquin Bank of

Modesto to finance the club, the banks advancing the money for the purchase of the calves and taking the boys' and girls' individual notes in payment. Fifteen registered Jersey heifer calves from six to 11 months old were selected by the Jersey breeders committee for this club from the herds of the following Jersey breeders: J. J. Cornwell, Orland; J. H. Sawyer, Galt; A. A. Jenkins, Tulare; J. E. Wherrell, Riverside; Geo. W. Thomas & Sons, Riverside; W. J. Hackett, Ceres; D. F. Conant, Modesto; J. A. Goodall, Keyes; C. D. Hayworth, Modesto; Guy H. Miller, Modesto.

The calves from outside Stanislaus County were shipped in by express November 12; the others arrived by wagon and truck November 13. All were collected in a barn near the high school in Modesto and were distributed to the boys and girls before noon of Saturday, November 13. The calves were each numbered and the numbers placed in a hat. Each member of the club drew out a number and secured the calf corresponding to his number. A photograph of the boys and girls holding their calves was then taken and they all loaded their calves into wagons and trailers and started for home to embark as future Jersey breeders of California.

These calves are all to be exhibited at the Stanislaus County fair at Modesto next fall and prizes will be awarded to the boys and girls that have made the best showing in caring for them and keeping an account of the cost of feed consumed. I think that I am correct in stating that this is the first strictly pure bred Jersey calf club organized in California.—Guy H. Miller, Secretary Stanislaus Jersey Breeders Association.

MEXICO COMES TO CALIFORNIA

Many Californians have thought of Mexico as a land of romance and revolutions and overlooked the real economic possibilities down there. In consequence the Mexicans have gone to the East and Middle West for their livestock, as well as other things. Lately certain firms have been making a bid for business in Mexico and the Diamond Bar Ranch has just made a sale of two carloads of Duroc sows and gilts, together with some boars and a dozen Hereford bulls to Cipriano Jaimes of Calzada Nacional de Ixtacalco, Mexico, D. F. In the lot were 30 registered sows bred for March litters, 13 fall gilts and 30 spring gilts, a spring boar by Ace of Pathfinders, one by Great Pathfinder and a two year old boar by Orion Cherry King 5th. At the same time Raoul C. Campillo of La Casita, Sonora, Mexico, bought a spring boar by Great Pathfinder and out of Model Maude, who was a member of the world's champion aged herd in 1919. He also took one fall and two spring gilts.

CHEAPER MEAT ANIMALS

Meat animals have been selling by farmers for a whole year ending with September, 1920, at prices that were lower than they were in the preceding year by 14 per cent. The fall in prices, compared with the former years, began in September, 1919. These statements are based on prices ascertained by the United States bureau of crop estimates.

Prices of these animals were gradually increasing to the calendar year 1914, but they fell eight per cent in 1915, followed by a gain of 17 per cent in 1916, of 49 per cent in 1917, when the peak of gain was reached, of 17 per cent in 1918, and of less than one per cent in 1919. Now, for the last four months of 1919 and for 1920 to September, there has been a recession of price movement with a drop of 14 per cent.

Veterinary

Goat With Cough

I purchased two milk goats a year ago and one recently commenced coughing. I gave it nine or ten drops of liniment and after this she stopped eating. I later put her on green grass and she is not so severely bothered at this time. She seems to be bothered when fed dry alfalfa or other dry hay.—Subscriber, San Luis Obispo.

The trouble you mention with your

goat is rather hard to diagnose from the information you give. It might be possible that she has a chronic inflammation or a cold which dust from

dry feed would irritate. The liniment you administered probably caused some digestive disorders. The liniment might serve as an anti-ferment but probably this was not what the animal needed. I would suggest that you administer about 1 pint of raw linseed oil which will act as a general purgative, after which you might feed some bran mash and green feed which would bring the animal up in condition, after which it might be able to throw off the cough. If she does not get rid of the cough with improvement in physical condition I would suggest that you consult a veterinarian who could look over the animal and no doubt could suggest a remedy.
—G. E. G.

Horse Coughs
Horse has a cold, won't eat anything and coughs all the time. What should I do to remedy the trouble? — Subscriber, Brawley.
The horse probably is troubled with a chronic catarrhal inflammation. I would suggest that you give him plenty of good fresh air although you should be careful that he does not stand in a draft. It might be necessary to put a blanket on him at night. You might give a mild laxative consisting of ¼ to ½ pound of Epsom salts in a pint of lukewarm water. If the cold continues you should give him about 1 teaspoon morning, noon and night of the following mixture: ½ pound saltpeter or nitrate of potash, ½ pound sulphur and ½ pound ground gentian. This can be given with the regular feed. He should also be fed good, soft food such as bran mash in addition to his hay.—G. E. G.

Mineral Matter for Pigs
What causes young pigs to wobble on their hind legs and sometimes drag them? What is the remedy? It does not seem to affect the appetite or to prevent growth. — Subscriber, Chula Vista.
The trouble you mention with your pigs is probably due to lack of proper nutrition. The pigs may be growing too fast for the strength of their bones, which makes it impossible for the bones of the legs to hold them up. The factor contributing to trouble of this kind is insufficient mineral matter in the feed, which, of course, does not give the bones an opportunity to grow and strengthen properly. I would suggest that you give them lime water to drink and as soon as they are able to eat mixed feed mix bone meal in with the other feed at the rate of 2 or 3 per cent by weight.—G. E. G.

Period in Cow and Sow
Will you kindly tell me how many days from calving before a cow comes in heat and at what periods following? Do they ever skip? Also how long does a sow go after farrowing before coming in heat, also at what periods following? What are the signs in a sow?—Subscriber, Turlock.
The answers to the questions above would depend somewhat on the care given the animals. If the cow is allowed to suckle her calf she seldom comes in heat sooner than six or eight weeks from calving although if the calf is taken away from her immediately she usually comes in heat about three weeks after parturition and every three weeks thereafter. Oftentimes the periods may be skipped although if all conditions are normal this is not usual. A sow ordinarily comes in heat from three to five days after her pigs are weaned and about every two or three weeks thereafter. The indications or signs of heat in these animals differ considerably with individuals. Ordinarily it consists in general restlessness and one who is acquainted with the animals can usually detect this restlessness without difficulty.

To The Holstein Breeders of California

Gentlemen:
We have bought Sir Ormsby Skylark Rauwerd and will accept a limited number of cows for service. To you who are well versed in Holstein pedigrees and records we need say no other word. But to those of you who possibly may be young in the business or who are not fully aware of what the Ormsby strain has done and is doing, we would suggest that you do not waste valuable years by raising calves from inferior bulls. Sir Ormsby Skylark Rauwerd is the best son of old Sir Ormsby Skylark who sired amongst other notable cows Dutchess Skylark Ormsby 1,506.36 lbs. butterfat in one year which is the world's record for any breed.

The dam of Sir Ormsby Skylark Rauwerd is Beauty Rauwerd Hengerveld 2nd a 34.5 lb. cow whose sire Prince Segis Korndyke had 59 A. R. O. daughters; and her dam was a 29 lb. cow.

Peter B. Kyne O. H. Cash

Sierra Vista Ranch Perris, California

HERD REDUCTION SALE Guernsey Females

We are over stocked with Guernseys and we offer a pick of anything on the place. Imported cows and A. R. cows, with high records and their show-winning offspring from such bulls as Effie's King and King of Hollow Hill. Also some wonderful producing 15/16 Guernsey grade cows and their heifers.

QUESTIONS AND ANSWERS
(Continued from Page 728.)

garding stocks, which were quite fully discussed in the issue of the Cultivator of March 23, 1916, by Dr. Fitzgerald of Stockton, he made comparison of Paradox and Royal hybrids. He said the Paradox hybrid root is sometimes seriously affected by oak root fungus and recommended that where planting was to be done in land formerly occupied by oak trees that the Royal, which was more resistant, should be planted.

VEGETATION IN RELATION TO ENVIRONMENT
(Continued from Page 721.)

ences in the vegetation. The application of nitrogen promotes the growth of grasses at the expense of legumes, while mineral fertilizers without nitrogen, particularly potash, enable the legumes, such as clovers, to make headway against the grasses. These conclusions are not exactly hasty, seeing that the experiments have been going on for considerably more than half a century. Grasses are perforce obliged to get their nitrogen from the soil, but legumes can take it from the air with the aid of bacteria. Consequently, land that grows good crops of legumes is apt to be well supplied with mineral plant food. On the other hand, the legumes, which might otherwise thrive, may be crowded out by other more vigorous plants. In taking stock of the vegetation this possibility of crowding out must always be considered, as well as the feeding powers of different plants, their habits of growth and susceptibilities to weather, pests and diseases. Then, aside from the kind of soil, the physical condition of soil and subsoil, the moisture, drainage and alkali content and lay of the land all have their effects. Regarding feeding powers, E. Truog found that buckwheat could make much better use of raw rock phosphate than certain other plants experimented with.

Among the weeds common in some California orchards are three which are high in nitrogen, namely, malva, mustard and nettles. These contain from three to four per cent of nitrogen, based upon the dry weight, and get their nitrogen entirely from the soil. Hence such plants are not apt to thrive on land decidedly low in nitrogen, in fact, in some instances good stands of malva have been grown only after applications of nitrogenous fertilizers. However, many weeds have great feeding powers and the application of nitrogen may benefit fruit trees and various crop plants in spite of the presence of high nitrogen weeds. Chickweed (Stellaria media) may have possibilities as an indicator plant of some kind as, in the citrus districts of Tulare County, it is commonly much more in evidence in orchards on dry bog soils and on other soils derived from basic igneous rocks. The same thing is true of a pretty pale blue phacelia (Phacelia ciliata). On the other hand, Shepherd's Purse, which is a weed that has followed man round the world, seems to grow under practically any and all conditions, which is also the case with Prckly Lettuce and many other weeds.

In eastern Riverside County the creosote bush may be seen growing rather sparsely on solid beds of gypsum, but it was noted that the other plants associated with the creosote bush in the vicinity largely avoided the gypsum beds. To one who has come under the spell of our southwestern deserts this creosote bush inspires much the same feeling as does the pine, beloved of the mountaineer.

Some striking illustrations of the effects of slight differences in environment are mentioned by E. J. Russell in his excellent book, "Soil Conditions and Plant Growth." For instance, in Romney Marsh there are pastures with rye grass, white clover, crested dog's tail and agrostis, easily capable of fattening sheep in summer without any other food. All round these pastures are others with the same type of vegetation, but the plants grow more slowly, produce more stem and less leaf, are less nutritious and are incapable of fattening sheep. Again, the grass on Lower Lias pastures in Somersetshire and Warwickshire causes acute diarrhoea or "scouring" in cattle, while grass on adjoining alluvial pastures does not. Finally, potatoes grown in the Dunbar district are remarkable for their quality and will stand boiling and subsequent warming up without turning black. The same varieties of potatoes grown in the same way in the Fens, blacken badly under the same treatment and consequently command a much lower market price.

Suffice it to say in closing that the study of plants in relation to their environment is of great scientific and practical interest and adds much to the pleasure of driving through the country.

—Your Hens Need LACTEIN CONDENSED BUTTERMILK NOW!

Egg Value--Tonic

LACTEIN Condensed Buttermilk stimulates the egg-producing organs to activity sooner after molt, because it supplies the necessary albumen and protein in the exact proportions; because the high development of LACTIC ACID content keeps the system in the finest of health, enabling thorough digestion of all foods. A combination of food and tonic which carries distinction by the most gratifying results secured in its use. **FEED LACTEIN NOW!**

Poultry Queries

Conducted by J. A. Koethen

Concrete Floor

Is it advisable to put a concrete floor in a brooder house, and if so what sort of floor covering or litter would be best?—Subscriber, San Diego.

The concrete floor is used in many of the most up to date brooder houses and is the best there is if properly covered. It should be covered with a thick layer of clean sand—not less than six inches—and the sand covered with straw or chaff or hay for the chicks to scratch in. Leaves from dry alfalfa hay make the very best litter for chicks, but any clean straw will answer.

Fattening Turkeys

I have a flock of young turkeys ranging from five to seven months old. They are getting greens and all the whole corn they will eat. What sort of fattening ration would you advise?—Mrs. B. J. W.

Whole corn is a very good fattening ration in itself, but you might keep both corn and barley before the birds. The barley gives variety and induces them to eat a little more. A dish of dry bran or of bran moistened with clabbered milk might be given once

dampness, and poor ventilation are the chief causes of roup. After keeping hens nine years on a steep south slope, with granite soil and open front houses, and never seeing a case of roup in all that time, either among my own hens or those of my neighbors, I am inclined to think drainage, both of water and of air, is more important than is sometimes supposed. Here on this hillside the ground is never muddy and the damp air falls away from us. My hens have waded in water in a sudden storm; they have roosted in front of cracks, and been wet through leaky roofs, but never a case of roup. To be sure, they always have fresh air and are never crowded, but I believe drainage counts most. Put your henhouses in a hollow where the dampness settles toward them instead of away from them, and you will have roup, no matter how perfect conditions are otherwise. Roup can be cured permanently only by removing the cause. If your houses do not admit as much fresh air as you would like yourself, if the hens are so crowded on the roosts that they come out into the morning air hot and ready to chill, if your runs are on ground so low that puddles stand in them for several days after a rain, if your houses are so constructed that they admit drafts and do not admit the sun, do not expect to cure roup permanently. Hens like dry air and dry roosting quarters and dry ground under their feet. An attack of roup can often be relieved by what is called the permanganate treatment. Buy ten

POULTRYMAN'S CALENDAR—DECEMBER, PREPARING TO HATCH

Plans for hatching should be formulated by the first of December or earlier. How many chicks are to be hatched the coming season? Of what breed? What sort of stock is desired, fancy or utility? The commercial poultryman has little choice. He keeps White Leghorns, and will either hatch them in his own incubators or engage them from a reliable hatchery. In any case brooder houses must be cleaned and disinfected and runs filled with succulent green ready for the little chicks. On these two factors depends a large measure of his success.

The case of the sideline is less simple. He may wish to buy a male bird to mate to hens of tested worth. He may plan to buy eggs from which to hatch young stock to improve what he already has. The fall shows have shown him where he can get vigorous stock of standard quality and he should have his eggs engaged before January and his new breeders in the runs early in December.

a day, but moist mashers must be very carefully fed and the droppings watched for any hint of diarrhoea. Most turkey people find corn and barley sufficient. The turkeys should not be shut up for fattening. Let them range as before. They are restless in confinement and apt to lose flesh rather than put it on.

Cannibalism

This is our first season with poultry and we find it no fool's job. Our first batch of chicks did well. Our second of 1,100 did better up to four weeks of age, then all in a day it seemed the whole flock had become possessed of a legion of unclean spirits, bent on devouring each other. This kept up for four weeks, and only perpetual vigilance saved the flock from complete annihilation. As it was, we lost but three. We are in a poultry community, but nobody could explain the attack. Do you know any cause or cure for such diabolism?—Subscriber, Sebastopol.

These attacks of cannibalism nearly always begin, I think, with some slight injury to one of the birds, an injury that may pass unnoticed by the caretaker. The chicks, which are naturally carnivorous, get a sight of blood, then a taste, and then go wild for it. The best cure is to get them out onto the ground where they will be kept busy scratching for bugs and worms, but every bird that has an abrasion of the skin must be kept away from the rest or they will attack it. Some authorities have thought additional animal food, in the shape, perhaps, of cooked meat, would check this craving for blood, and it probably will, if there is no temptation to attack other chicks, but no chick, it seems, can withstand the sight of blood.

What Causes Roup?

Please tell me what causes roup. Is there any cure for it? If so, what is it?—Subscriber, San Juan Bautista.

Dampness, poor drainage, which is frequently the underlying cause of

cents worth of permanganate of potash crystals at the drug store, and twice a day put a few of these crystals in a lard pail of warmish water, just enough to turn the water purple. Dip the hen's head in this solution, after massaging the nostril just below the eyes to loosen up the secretion, and hold it there a few seconds. Repeating this treatment morning and night, always with a fresh solution, for the permanganate loses its strength if it stands, often has quick and satisfactory results.

Soft Shells

My hens frequently lay soft shelled eggs. Can you suggest cause and cure?—Subscriber, San Juan Bautista.

Lack of oyster shell may be the cause. Hens must have lime to make shells, and oyster shell provides this in most convenient form. Sometimes pullets that are laying before they are quite mature lay a good many soft shells, and sometimes old overfat hens do the same. In the case of the pullets, stop forcing them and give them time to learn to make a perfect egg. In the case of the overfat hen, try to reduce her by cutting off most of her scratch grain. As I am not told the age of your hens nor their breed I can only hope that one of these suggestions may fit.

Blue Ointment

Is there any truth in the statement that blue ointment is fatal to a chicken if the chicken gets wet after it has been applied? It is the only effective remedy I have used for lice, but it has been raining here so long that I hesitate to apply it. — Subscriber, Arhuckle.

In a bulletin issued by the Storrs experiment station, entitled "Some Lice and Mites of the Hen," I find these words: "Mercurial ointment (blue ointment) sometimes causes a slight burning, shown by a reddening of the skin, which happens more commonly on young chickens. It is thought by some that this is brought about by

the bird becoming wet after the treatment. We have never had any serious permanent effects from this burning." This bulletin recommends the use of blue ointment very highly, but says it should be mixed with vaseline, one part ointment to one or two of vaseline, and should be applied just beneath the vent, a bit the size of a pea being used for each bird.

Mash for Layers

I am mixing my own dry mash by the following formula: 6 parts mill-run, 3 parts coconut oil cake meal, 2 parts barley meal, 1 part beef scrap. I think of adding corn meal and alfalfa meal. Can you make any suggestions regarding this ration? My hens get sprouted barley (sprouted eight days) in the morning and Egyptian corn and cracked corn at night. I plan to add milo maize and kafir corn to this scratch ration.—Subscriber, Oakdale.

Your mash, as you are feeding it, is far too rich in coconut oil cake meal, and your scratch feed, as you plan it, will be all corn as it is now. The addition of corn meal and alfalfa meal to the mash will be an improvement, but you should omit part of the oil cake. As a rule, no more vegetable protein is used than animal protein. This is one of Professor Jaffa's formulas: Bran, 6 quarts; shorts, 2½ quarts; corn meal, 1½ quarts; coconut oil cake meal, 1 quart; beef scrap, 1 quart; coarse bone meal, ½ quart. As you wish to use the barley meal, you might make your formula 6 parts bran, 1 part corn meal, 2 parts barley meal, 1 part alfalfa meal, 1 part each of coconut oil cake meal and beef scrap, and ½ part bone meal. Then instead of two or three kinds of corn in your scratch, make equal parts corn and wheat or corn and barley. You can use both cracked corn and milo or Gyp corn if you wish, but do not make corn or sorghum, which is not very different, more than half the grain ration.

Swellhead in Turkeys

Some of my turkeys have a swelling between the nostril and eye, sometimes on one side, sometimes on the other. After a time it breaks and runs. I have found no remedy that does any good. What would you advise?—Subscriber, San Joaquin.

Your turkeys have swellhead, which is a form of roup. The simplest remedy is the permanganate treatment. Get ten cents worth of potassium permanganate crystals at the drug store. Fill a lard pail or quart measure with warmish water and drop in just enough of the crystals to give the water a deep pink color. Into this dip the head of the affected bird and hold it under for from ten to 20 seconds. I usually dip twice, ten seconds at a time, but the books advise 20 to 30 seconds at once. You can tell when your bird has had all it will stand. Before dipping, massage the nostril and swelling gently with thumb and finger to loosen the secretion. The purpose of the treatment is to thoroughly cleanse the nasal passages, and it should be repeated twice daily, always with fresh solution, till the bird is well. You do not say how old your turkeys are nor where they roost. Turkeys that roost out of doors, as all turkeys over three months of age should, ought not to have roup. Try to find out what is causing the trouble. Removing the cause is the only real cure.

Catarrhal Cold

My chickens seem to have a cold. They sneeze and run at the nose. They roost in an open front coop facing south. Please give remedy.—Subscriber, Ojai.

The open front coop and south front are all right as far as they go, but they will not keep chickens from taking cold if they are crowded or if the coop stands in a low, damp place where water settles after a rain or the air is damp and chilly. Remedy conditions first, then try the following treatment, which is recommended by Dr. Salmon: Pulverize and thoroughly mix the following: 4 drams gentian root, 4 drams ginger, 2 drams sulphate of iron, 1 dram hyposulphite of sodium, 1 dram salicylate of sodium. The dose is 3 to 4 grains daily for a medium sized bird. If the eyes are sticky or there is a good deal of dis-

charge from the nostril, wash once or twice a day with a 3 per cent boracic acid solution or a 2 per cent carbolic acid solution. Remember, however, that doctoring does very little good unless the cause of the trouble is removed.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, October 30, 1920.
Final report for the year ending October 29.

A pen of barred Rocks from New York won the ninth annual egg laying contest conducted by the Connecticut agricultural college at Storrs. This is the first time in the history of the laying trials that the same breeder with the same variety of hens has been able to win two years in succession. The winning pen was entered by Jules F. Francis from Westhampton Beach, Long Island. These ten pullets laid 2,234 eggs, or an average of more than 220 eggs for each hen in the pen. Steady laying during the last half of the year won this pen its place and the blue ribbon for the year. It first took the lead in the twenty-ninth week of the contest, dropped back into second place in the thirty-fourth week, regained its lead three weeks later and held out until the end. This is the third time that Barred Rocks have outlaid all competitors, as can be seen from the following list of winners and their records in the contest at Storrs during the past nine years:

1912, White Leghorns (5 birds), 1,071. 1913, White Leghorns (5 birds), 1,190. 1914, White Leghorns (10 birds), 2,088. 1915, White Wyandottes (10 birds), 2,072. 1916, White Wyandottes (10 birds), 2,265. 1917, Barred Rocks (10 birds), 2,119. 1918, Oregon (10 birds), 2,352. 1919, Barred Rocks (10 birds), 2,022. 1920, Barred Rocks (10 birds), 2,234.

There were 1,000 hens in the contest of 14 different breeds and varieties and from 13 states and three of the Canadian provinces. They laid a grand total of 161,455. The following shows the number of birds in each of the four principal classes, the average individual egg yield for the year, and the general average for all varieties that participated in the contest:

500 White Leghorns, 161.8; 200 Plymouth Rocks, 163.5; 140 Rhode Island Reds, 162.4; 90 Wyandottes, 165; 70 miscellaneous, 145.6; 1,000 average of all breeds, 161.5.

High individual records interest every pedigree poultry breeder in the country. The most remarkable performance of the year in this respect was the record of Barred Rock hen owned by Rock Rose Farm at Katonah, New York. This hen laid 77 eggs without a miss, skipped one day and laid 26 more. In other words, she laid 103 eggs in 104 days. This record has not been equaled in any of the previous competitions at Storrs. Two Barred Rock hens, Nos. 54 and 58, both from Westhampton Beach, Long Island, tied for highest individual yield for the year with scores 281 eggs each. In the Wyandotte division hen owned by Langford Poultry Farm from British Columbia, finished first with a yield of 267 eggs. The best Rhode Island Red hen had record for the year of 269 eggs. White Leghorn from Hollywood, Washington, outlaid every other Leghorn in the contest and scored 254 eggs.

The following list shows the 20 leading pens in the order of their production, also their record for the year:

Jules F. Francis, Barred Rocks, 2,334; Oneck Farm, Barred Rocks, 2,182; Pinecrest Orchards, Rhode Island Reds, 2,162; Hollywood Farm, White Leghorns, 2,119; E. A. Ballard, White Leghorns, 2,048; Chicatawbut Farms, White Rocks, 2,035; W. Edgar Baker, White Leghorns, 1,998; C. Rasmussen, White Leghorns, 1,979; Deer Brook Farm, R. I. Reds, 1,962; George Phillips, White Leghorns, 1,935; Harry D. Emmons, White Wyandottes, 1,915; Ingleside Farm, Barred Rocks, 1,904; A. E. Hampton, Black Leghorns, 1,859; Rock Rose Farm, Barred Rock, 1,874; Jacob E. Jansen, R. I. Reds, 1,866; Small's Poultry Farm, White Leghorns, 1,856; T. J. Enslin, Columbian Rocks, 1,853; A. P. Robinson, White Leghorns, 1,845; A. L. Anderson, R. I. Whites, 1,844; W. H. Bassett, White Rocks, 1,841.

4,200 Eggs From 48 Hens

Simply write me and I will send you a big triple size box of my famous Buttermilk Compound Tablets by return mail, postpaid. I want you to know that you can double and treble your poultry profits by doubling or trebling your egg yield—perhaps get five to seven times as many eggs as did many of my friends last winter by using these wonderful tablets. Fed in drinking water or feed. Because I want these tablets known in every township in America I say: Try them at my risk. If you like them, tell your friends. If not, you are not out a cent.

Over 10,000 People Wrote Me Last Year

Here are a few samples of the kind of letters I get from all parts of the United States.

4,200 Eggs.

I used two boxes of your tablets. Before using them I got only 6 eggs a day. Within two weeks I was getting 12 to 15 eggs a day. In seven months I got about 350 dozen (4,200) eggs from my 48 hens. I did not have any Roup. I give your tablets the praise.
MRS. ARTHUR TUCKER, Wilkeson, Ind.

75 Eggs Instead of None.

I found the tablets were fine to start hens to laying. Before using the tablets I wasn't getting any eggs. Within 10 days after using tablets increase started. I was finally getting 75 eggs a day and fed the tablets until spring.

MRS. R. H. TULTZ, Scranton, Kans.

Makes 'Em Lay in Coldest Weather.

Last winter I fed two boxes of your tablets mixed with feed. Before using tablets got only 12 eggs a day—afterward 30 to 36 eggs a day. This was within three weeks. After feeding the tablets six weeks got 60 and 60 eggs a day and in the coldest weather in winter.

MRS. ELMER HOTTMAN, Ridgeway, Wis.

Best Tablets Made.

The Buttermilk Compound Tablets I think are better than the common tablets. I got more eggs within two weeks after using them. I have some other tablets but the "Buttermilk" are the best. I fed three boxes last winter. My flock did not have the Roup. Will send for more tablets.

MRS. WALTER ELLIS, Gypsum, Kans.

FREE

Because I want one million new users of these wonderful tablets I am willing to send you a big triple size box if you will just write me. Your name and address is all I need. Use a postal card if you wish—I'll send the tablets by return mail, post paid. You use the tablets 30 days then report results to me. If you are not satisfied in every way—if you are not more than pleased—the tablets are to cost you nothing. But if you do find that you get many, many more eggs—probably three to five and even seven times as many—and your flock is healthier than ever before—full of pep and strutting around with healthy red combs—the tablets cost you only \$1.00. No matter what you have tried before, I want you to remember that my secret formula is absolutely different from anything else—that it has been known to succeed where others failed. Not only that—you must remember that I send you a big triple size box—nearly three times as big as the ordinary box of tablets.

At any rate, the risk is all mine. You can't afford to pass up this Special Introductory offer a single minute—it may never be made again.

Send No Money—Just Write Me, That's All.

All I need is your name and address—just put it on a postal card or use the coupon below—I'll understand and send you the tablets post paid by return mail.

R. C. COMBS, Gen. Mgr., Milk Products Co.
660 Creamery Bldg., Kansas City, Mo.

As per your offer send me your big triple size box of Combs' Buttermilk Compound Tablets. I understand I may use the tablets in a 30 days' test, and if satisfied they cost me \$1.00, otherwise they are to cost me nothing.

Grain Exch., prices bid November 30: Milo: Carlots, 1.91¼@2.05; No. 3 Eastern blk., 1.72½.

Corn: Bulk, No. 2 Yellow, 1.95; No. 3 White, 1.75.

Bran: Kansas, 39.50.

Kafir: Eastern, 1.82½.

Wheat: Mixed feed 39.00@41.50 per ton.

HAY

Alfalfa Growers of California, report under date of November 30:

The market for alfalfa hay continued throughout the week under good demand which was met by adequate supplies at unchanged prices. The alfalfa situation is inherently strong as far as production and requirements are concerned; the market is therefore in a healthy condition in decided contrast to most other general farm products at present.

There were 1,000 tons received on the tracks in Los Angeles the week ending November 27 as against 750 tons the week before.

Citrus Markets
Los Angeles, Dec. 1, 1920.
Northern and Central California packing houses are running full handed and weather conditions have favored shipment for all fruit is coloring and sweetening very satisfactorily. But few sections south of the Tehachapi are yet shipping. Prices are very satisfactory for good stuff but there is a wide spread because of great difference in quality. Some fruit has been picked so green that shipment was prevented by standardization officials.
Lemons show no life whatever. When any quotation f. o. b. California is made at all it is around \$2.00 and \$2.50 but some fruit has been thrown into the auction and sold for even less than freight charges.
Shipments
Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 278 cars; lemons, 348; total, 626. To same date last season: Oranges, 2,129; lemons, 371; total, 2,500. From Central California to date this season: Oranges, 983; lemons, 21; total, 1,004. To same date last season: Oranges, 891; lemons, 69; total, 960. From Northern California to date this season: Oranges, 89; lemons 1; total, 90. To same date last season: Oranges, 88; lemons, 1; total, 89.

AT THE AUCTIONS

Snow on ground at Summit, 15.0				

The Bean Giant at work in 600-acre Baker-Langdon Orchards at Walla Walla, Washington.

The "Bean" Giant

for Large Capacity and High Pressure

IN large orchards where they have to cover the ground quickly—where High Pressure and Large Capacity are absolutely necessary—the Bean is the universal choice.
The Bean Giant shown above supplies several lines of hose, delivers from 5½ to 10 gallons a minute, and drives the material onto the trees at tremendous pressure in the form of a dense, penetrating, saturating mist which reaches every crack and crevice.

Bean Large Capacity and High Pressure are the result of these features—

- BEAN UNDERNEATH SUCTION allows the liquid to flow from the tank to the pump without help from the engine.
- BEAN DIRECT-GEAR CONNECTION prevents loss of power thru belt slippage.
- These advantages together with BEAN SMOOTH PORCELAIN CYLINDERS and BEAN ECCENTRICS (used instead of cranks) so reduce friction and save power that a Bean Sprayer will throw more liquid than any other outfit with the same size engine.

It is a well established fact that you can throw as much liquid with a Bean two-cylinder outfit as with most three-cylinder machines.

Send the Coupon for New Bean Catalog—It illustrates and describes the entire Bean line of Hand and Power Sprayers, and explains in detail the many distinctive Bean advantages. Write for your copy—now.

Christensen & Beaulieu of Mt. View, California, were up against the problem that is now facing ranchers all over the state. The water level in their well had fallen so low that their old vertical pump wouldn't get more than half of a supply.

They might have dug the old pit deeper, and worried along a while with the old pump—but they weren't going to be satisfied with temporary makeshifts. They wanted permanent results! So they installed a Bean Turbine in the same well where the old pump worked—and they got permanent results—

- they have a good supply now.
- a good supply insured for the future.
- pit dangers eliminated.
- money saved.
- time saved.

If your water levels are lowering, your problem is the same—solve it with a Bean Turbine.

A BIGGER AND BETTER COLLEGE OF AGRICULTURE

(Continued from Page 719.)

Issue of the California Cultivator, the controversy hinges mainly on two questions, that of comparative living costs at O. A. C. and U. C., and comparative opportunities to coordinate theory and practice and to get through college quickly.

As a foreign student, not yet a year on American soil, I can say nothing to elucidate either question, but if I may venture an opinion as to the advisability of moving the agricultural college to Davis, I should most emphatically urge that the system remain as it is, partly for the reasons given by R. T. Robinson in the Cultivator of September 18, namely that duplication of prerequisite instruction and laboratory facilities would cause a number of difficulties, less efficiency and greater expense. Furthermore, I believe it to be a great mistake to attempt to segregate one class from other classes of society. The gregarious instinct in man is strong enough to bring farmers together once they are farmers, and enough young people leave the country to lose themselves in the cities because of this tendency to cut rural life and its activities adrift from the rest of civilized society.

The greatest need, to my mind, is to give the country boy an education equal to that of the city boy in the same sphere in which the city boy gets his, not to force him into a cul-de-sac as under the German rural education system, from which he could find no opening at the top.

Let it not be thought that I see no advantages in having the agricultural college at Davis. There are a number, but I think they are sufficiently outweighed by other considerations. The cooperative organizations in this state, created by democratic efforts to solve economic problems, have much improved the outlook for agriculturists, but this is only a beginning. It is necessary for country and city to cooperate, and the U. C. makes that possible for California by bringing together the country student, future producer of food and raw materials and consumer of finished products, and the city student, future consumer of raw materials and producer of finished products.

Producers have to a great extent cooperated. Consumers are beginning to do likewise. Interrelations will have to be friendly and between these two sets of cooperative activity a proper place will have to be found for distributors in the future. College men and women who rub shoulders on this campus now will be better fitted to adjust future relations between themselves in their various fields of work, when the necessity to do so arises, if they are not segregated into separate camps.

Below the very comprehensive letter in the issue of October 9 I was surprised to find that of A. L. Wisker, couched in rather cynical terms. I agree with him that theory does not make a practical farmer; the practical man, however, may lack scientific foundation, which he cannot easily acquire outside of college. The theorist, though, can find all the practice he wants, especially if he and those who deride him will quit thinking that his education is complete. He has only passed his "school tests" and so acquired his "tool chest." He still has to learn to use them.

As to the need of "such a housecleaning," I feel it my duty as an insider to say that it would be miraculous not to find in a heterogeneous aggregation of 10,000 men and women a few lax or misguided individuals of those whose friendship one does not particularly care to cultivate. Yet from my contact with university life since January, including the summer courses, I must say that I still have to find those bad eggs, although I have not been backward in coming forward among my fellow students. One does not often find anything unsought. It does seem unfair for armchair critics far removed from the scenes of campus life to blame and brand the whole university population for the deeds of some undesirables, ferreted out, brought to light and either adequately punished or referred to the proper authorities by the student body itself.

Is it not to the credit of university

students that they are doing their own "housecleaning"?

Considering all things, I have not met with disappointment here as yet. I had in mind before I came the thorough and efficient educational facilities of the U. C. agricultural college, the high standards and the democratic spirit which were said to prevail. I have so far found all three of these factors up to my expectations and worth my journey of about 11,000 miles from the Union of South Africa to avail myself of them.

By J. Francois De Villiers

The reputation of the college of agriculture of the University of California has been spread all over the globe. Even the southern part of the continent of Africa has heard the echo. Hence my decision for coming all that distance for obtaining systematic knowledge and research in agriculture which has an unexcelled standard as this college. I might add that as regards the interrelationship of student and student, intercollegiate in its nature, and genial relationship between the professor and his student, nothing better is desired. I have found everything here beyond what was expected, and would therefore always be ready to respond favorably to a query concerning the factors that influenced my decision in attending the college of agriculture of the University of California.

By L. N. Irwin

The Royce article recently appearing in your paper covering the subject of our "130 California Men at the Oregon Agricultural College" has aroused me to see what can be done to change conditions to overcome this failure to hold our men here at home.

I am sorry that Mr. Robinson didn't take the pains to find out and give to us in his article in the September 18 issue the number of Oregon men and women attending the college of agriculture at Berkeley. It is reported that there are some 200 home state students at the O. A. C. this fall. If this increase keeps up we may likely expect 300 in another year.

In a limited way I have just completed a survey among my friends and neighbors, including ranchers, dairymen, business men, graduates of U. C., and associate editors of two of our leading agricultural papers, on the subject of our college of agriculture. In every instance the opinion was given, as essential to an improvement of the college of agriculture, that the college be brought to Davis where the state has provided a farm equipped for educational and experimental work. If this common expression is typical of the thought general of our agricultural population and citizenship, can we not consistently and hopefully get behind a movement to bring about this proposed change?

With the great onward progressive movement to supply secondary agricultural education through our elementary schools, have we not outgrown the real need of the farm school at Davis which is in reality a secondary school? The good start the state has made in equipping our state farm for educational purposes readily paves the way towards the goal of making Davis the seat of the "college of agriculture." When the task is accomplished and the college properly equipped for its work and when thorough practical courses in scientific farming and an earnest endeavor is made to offer the best opportunity possible for higher agricultural education, it is difficult to imagine any Californian seeking an agricultural education outside of the state.

As there is surely a great advantage in acquiring an agricultural education amid real farm activities, where everything breathes of the country life, where farm life is studied, practiced and enjoyed, there is also great advantage in having the college of agriculture accessible to our many and varied farming interests. To locate then the college nearer the center of our farm activities will strengthen and increase its sphere of usefulness.

It was on a May afternoon last spring that I dropped in at the office of the animal husbandry building on the farm. Prof. True had just returned from a meeting of beef cattle men. He made this significant remark upon greeting me:

LATEST OUT Log and Tree Saw

NOW you can get the latest WITTE Arm Swing, Lever Controlled, Force Feed Log Saw for sawing up logs any size. Moves like a wheelbarrow—goes anywhere—saws up-hill, down-hill or on level. Cuts much faster than former rigs. Operated by a high power, frost-proof

WITTE 4-Cycle Engine

Costs only 25 to 50 cents a day to operate. Double the power needed for sawing logs or trees. Perfectly balanced rig. Can be used for belt work.

MEN WANTED
TO LEARN AUTOS & TRACTORS
IN LOS ANGELES

Men of any age with no previous experience can learn auto and tractor business in few weeks. Earn Big Money as repairman, tractor expert, or go into business for yourself. We help our graduates get started. Only school in America giving advanced auto-electrical training and actual garage and repair shop practice. All year 'round tractor field work. Training includes tire repairing, machine shop, driving and repairing all makes of autos, tractors and gas engines. Earn board and room while learning. Success assured. Jobs waiting. Write NOW for FREE book of facts telling about your chances in this business. Tells about men from your home town who are successful National graduates.

NATIONAL AUTOMOTIVE SCHOOL
826 S. Figueroa St. Los Angeles, Cal.

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

"We have just come from a conference where plans were made which, when put into operation, will put the cattle business ahead just five years."

Let the college of agriculture be located where it can easily and readily share the spirit of country life and respond to the call of the problems confronting our rural population. Let the members of her faculty be in tune and sympathy with the needs of farm life and qualified not only to impart agricultural knowledge but also to train and direct the young people of our state to be leaders in the great community and cooperative enterprises confronting our rural population.

A Resolution

The students in the college of agriculture at Berkeley feel very strongly opposed to this suggestion to move the college to Davis or any other place, for several reasons:

First, we feel that the tendency in present day education is towards too great specialization. We seem to be preparing ourselves merely to make the greatest amount of money in the shortest time without any thought for a broad education or the appreciation of the finer things in life.

Second, if the college of agriculture were to be moved from Berkeley to some other place, we would be deprived of the opportunity to take any courses other than those having a strict bearing on agriculture, whereas we may now take as electives such courses as history, English, political science, economics, psychology, etc.

Third, the strict application of our studies in agriculture can be learned at the university farm by spending a reasonable proportion of the four years there. Recent arrangements have made it possible for the student to spend more time there than formerly, and plans are well under way for further development of the part of the course to be given at Davis. We feel that if a man in inherently qualified to be a farmer the practical side of the work will quickly be learned after he gets onto a ranch, and this tardiness will more than be offset by the advantages of a broad education.

Fourth, the advantages of association with a great number of students studying many different subjects and having such a variety of interests, and of exchanging ideas with them, are so numerous and apparent that they need hardly be mentioned. The opportunities that we now have of attending lectures on an almost unlimited number of subjects, of participating in activities not directly associated with our agricultural college, and of broadening our minds by studying other subjects more than offset the temporary advantage of graduating from the university as specialized and finished farmers.

We feel that a college education means more than to fit a man to be a specialist in one line. It should give him a broad and unbiased outlook on life, should enable him to think clearly on all subjects, and should prepare him to become a leader and a factor for the advancement of his community and the nation.

And it was after a consideration of these points that the agriculture club unanimously adopted this resolution.

(Signed) Edgar D. Boal, President Agriculture Club; R. G. Meckfessel, Sydney A. Anderson, Scott B. Harrington, Ashley C. Browne, Glen C. Raddatz, Welfare Committee.

COCONUT PRODUCTS

The Agricultural Bulletin of the Federated Malay States, in an article on the coconut palm in the Philippines and its productions, says that the export of copra and oil is chiefly to San Francisco. Therefore we are interested to know that the total number of coconut palms in the Philippines, according to government count in 1918, was 31,000,000. The yield was 892,000,000 nuts, or about 29 for each palm. The best district, Zamboanga, averages 45 nuts per tree. The export of copra is valued at more than \$2,250,000 annually and the oil at more than \$2,000,000.

Colusa County growers anticipate that the state fish and game commission will endeavor to secure amendment to the law permitting killing of jackrabbits at all seasons.

—You can't make
a real profit in
the dairy business

Unless
you use a

GRAIN FEED!

Why? Because a highly concentrated grain feed like SUREMILK is necessary not only to balance the feed elements required by a cow but to *reduce* the cost of milk production. It costs just as much to take care of a string of cows whether each cow yields 4 gallons or 2½ gallons of milk per day. So, where's the dollars-and-sense in letting them "fill up" on straight roughage that only taxes their urinary and digestive organs and that nets you neither milk nor money?

SUREMILK is based on the practical findings of hard-headed dairymen. It is a

mixture of by-products from the table cereals manufactured in the Sperry mills at Stockton. Its quality and uniformity are guaranteed by constant inspection and analysis. There's no guess-work about SUREMILK—or what it will do.

If you want to see why SUREMILK has helped many a dairyman to put his herd on a paying basis—if you want to see why the highest priced concentrates are cheapest in the long run—send for your copy of our booklet, "*Converting Feed into Money.*" Simply cut out and mail the coupon today—it's free!

NOR, for that matter, can you make a real profit raising hogs unless you balance their ration with a grain feed. You must remember that the digestive tract of the pig is small and unlike that of the cow. The cow's stomach is equipped to handle bulky roughage. The pig can not—or, at least, Mr. Porker will gain very little on pasture alone. Growing pigs demand some form of grain. And the successful hog raiser recognizes their need for it. He knows, too, that SUREMILK supplies this essential element in a fattening hog's ration. It has a greater feeding value than the best barley. Economical, too! For it is highly concentrated in feed value and does not bulk.

As the Giant Reed Grows in Coachella Valley

Arundo Donax. This escape from the garden, now "run wild" in California, is native to South Europe, evidently the warmer parts, for it seldom flowers with us. But it makes almost a phenomenal growth and is of value planted in washes to hold soil from washing or channels deepening. Also of value as a windbreak or to screen unsightly objects from view. Cut, the stems are used to wrap citrus and other trees to prevent frost damage, also to thatch arbors or even temporary living quarters---especially valuable in warm semi-arid sections. ¶ Grows best in wet soils.---Photo taken near Mecca.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against
loss through dishonesty of any adver-
tisers in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice of
complaint must be sent us within 30 days
from date of the transaction, and the
subscriber must have mentioned the
Cultivator when writing the advertiser.

EDITORIALETES

Many have seen the giant reed
growing along our streams, sometimes
so far from human habitation that it
is considered a native of the state.
It is not, but, like many of the rest
of us, has become thoroughly Califor-
nian. The most luxuriant growth we
have seen of this reed is in the Coa-
chella Valley. Just at the left of the
beautiful scene on the cover a great
hole had been carved in a clump of
this reed and a perfect garage made.
The protection from both rain and sun
was complete because of some eight
or ten feet of solidly matted reeds
above. This reed is grown by the side
of one of Coachella Valley's perpetu-
ally flowing wells. Continual irrigation,
with Coachella Valley soil and under
Coachella Valley sunshine all add to
the beauty of the scene shown on the
cover.

* * *

Things are a bit quiet along some
lines, but raisins and some other fruits
are quickly picked up and we are told
by an orchardist who had planned ex-
tensive enlargement of his orchard
this season that the man who wishes
to be sure of trees for this season's
planting should make contracts at
once. There are not now sufficient
trees to meet the needs if half of pres-
ent plans are carried out. The planter
who is late in making definite ar-
rangements may be unable to secure

trees until another season, and the
loss of a year's growth and the satis-
factory markets which it is believed
will prevail on all of our staple fruits
will more than offset any possible low-
ering of price which other years may
bring.

* * *

Furthermore, in placing contract for
trees we believe that stock which has
been budded with buds selected with
an idea to greatest production of high-
est grade fruit should have first con-
sideration. The amount of this stock
is all too limited. Therein will the
early contract have particular advan-
tage.

* * *

Are we farmers going on a strike?
Are we going to limit production? Are
we going to combine and profiteer?
These and a bunch of other long ques-
tions are floating about. We think we
have a perfectly correct answer to all
three of the questions, and that is sim-
ply "No." The farmer is opposed to
strikes, and even limiting production
by a general argeement is considered
by some as having a bit of the flavor
of a trust, and as to profiteering we
believe we are entirely correct in as-
suming that the vast majority of farm-
ers at least are content with reason-
able profit. But the business man who
does not consider the law of supply
and demand soon fails and the farmer
who simply obeys the cry, "Produce
More," without stopping to consider
the market, the supply on hand, the
amount which probably will be pro-
duced, or other considerations affect-
ing market values, is liable to come
to grief.

* * *

The government has been backing
and filling more or less in the Raisin
Association case. Its present attitude
favors amending the pending bill
against the Associated by charging
that the acts complained of were in
violation of the interstate commerce
law. A motion has now been made
to set aside the stipulation entered
into by the attorneys of the Associ-
ated and the government in which
the company agreed to abandon prac-
tices which had been objected to by
the government. It has been agreed
that the questions involved shall be
argued before Judge Bledsoe in Los
Angeles, December 20.

* * *

The suspension of diversion privi-
leges and change in rates on fruits
from California to overland points has
been suspended by the interstate com-
merce commission until March 31.
Meantime California fruit shippers will
gather a fund of information which
will doubtless continue the privilege.

* * *

Farm wages have been dropped by
farmers of Butte County from \$4 to
\$2.50 per day. Tractor drivers will
receive \$4. Dispatches announce that
the men practically all remained on
their jobs. Liberty steak and bacon
remain up, however. Let the retailer
take advantage of some of the low
prices which the packer is paying for
livestock these days and give us rea-
sonable meat—and, incidentally, there
are shoes, furniture and some other
things.

* * *

Los Angeles County's coroner is
now holding a trifle more than an
average of one inquest per day be-
cause of deaths due to automobile ac-
cidents. There are more than ten ac-
cidents every day in the city of Los
Angeles alone. Nearly 400 people
were involved in the month of Novem-
ber and 31 were killed or died as re-
sult of these accidents. To be sure,

there are 22,000 automobiles using the
streets of that one city alone, and in
this vast number of drivers there must
of necessity be careless ones. Nor
is this city alone in the slaughter, for
it is charged that the loss of life an-
nually by automobile accidents in the
United States is greater than the num-
ber of American boys who lost their
lives in the recent war.

THAT "BAG OF RICE"

A short time ago I read your
editorial entitled: "Buy a Sack of
Rice." At the same time I searched
the columns of The Cultivator for an
ad that would tell me where to buy
this rice. How is a fellow going to
get any rice or any other produce that
these fellows have on hand if they do
not advertise and let the public know
where to buy? If I had a surplus on
hand I imagine a small ad in The
California Cultivator would help re-
duce the surplus and also be appreci-
ated by a lot of farmers and other
folk that are paying retailers enor-
mous prices. The olive people want
to sell their olives. Who are they?
Where do they live? How much do
they want for their olives? How many
olives have they to sell? What are
olives good for? Let us hear from
them. We may buy an olive or pos-
sibly a couple of olives. Anyhow, we
will keep on reading the ads and buy
what is advertised.—Frank Littig.

We appreciate Mr. Littig's belief in
the advantage of reading the adver-
tising columns; they surely contain
much of real value.

The rice growers are not yet organ-
ized so completely that they have ar-
ranged either to sell single bags of
rice or to advertise them through our
columns, but they are members of the
Cultivator family, so we are glad to
pass on the "Buy a Bag" suggestion
of the Rice Growers Association. A
letter from the association, in answer
to request similar to Mr. Littig's, says
that the association can hardly sell
these single bags and pay the local
freight rate which would be required
to distant parts of the state and get
them to the consumer for much less,
perhaps not even for as low a price
as the consumers may secure them
of their grocers.

So the Cultivator man took a walk
to the nearest large grocer, and here
are some Los Angeles prices: Broken
rice, 6 cents per pound, \$4.50 per 100
pound sack; Blue Rose, 13 cents per
pound, \$10 per hundred; Head rice,
Extra Fancy, 15 cents per pound, \$13
per hundred; polished rice, Jap style,
10 cents per pound, \$7.50 per hundred;
Extra Fancy package whole brown
rice, 27½ cents per pound straight.

The larger cooperative organizations
are confronted with so many difficul-
ties that it is probable it would not
be wise to attempt disposal of their
products at retail.

BENJAMIN HOLT

Benjamin Holt, father of the
caterpillar idea in tractors, is dead.
He was born in New Hampshire, Jan-
uary 1, 1849. He came to California
in 1883, first engaging in a hardware
business, later beginning manufactur-
ing in a small way. He was one of
the first to see the needs of California
agriculture and began the manufac-
ture of the old time steamer tractor.
His shops being located at Stockton,
he soon became familiar with the dif-
ficulties confronting tillers of the delta
lands and saw the need for a tractor
which would stay on top of soft
ground. Writing regarding Mr. Holt's

life work, Mr. Walker, secretary of
the Holt Company, once said:

"The necessity for some other means
of traction than is offered by wheels
became evident when the big steam
engines were sent down into the re-
claimed tule lands of the California
Netherlands to do plowing and har-
vesting. Wheels as wide as 18 feet
on each side of the machine were used,

but even these did not present enough
surface in contact with the ground to
prevent sinking. Mr. Benjamin Holt
therefore developed the idea of a self
laying track and invented the first
track type of tractor which appeared
as a commercial success early in the
1900's."

From this "caterpillar" development
came the big tanks which were one
of the greatest factors in the settle-
ment of the World War. Mr. Holt and
his family have built up one of Cali-
fornia's greatest industries in Stock-
ton and from it has sprung a branch
which has become even greater than
the home factory, at Peoria, Illinois.

SAVING THE OLIVES

We cannot help but feel that
our state board of health has been a
bit unwise in its ruling that no olives
which have been processed at less than
240 degrees for 40 minutes shall be
sold. Such ruling as to canned or
bottled goods is doubtless entirely
wise, for it is known to be perfectly
safe. It is also fairly definite that
olives cured in open tub or vat and
stored in open barrel or other con-
tainer in brine have never been known
to cause botulinus poisoning, and we
believe the sale of this home cured
fruit amongst the neighbors of the
olive grower might be permitted. If
our packers were able to handle the
entire output such a move would per-
haps be unwise as an advertising
proposition, but buy them all they can-
not, and growers are continually com-
ing to this office and asking, "What
shall we do with our fruit?" and sev-
eral requests have come as to methods
of home making of olive oil.

In order to give a little information
along this line we repeat on page 760
of this issue an article written for the
Cultivator by Mr. Cruess some two
years ago. In addition, in next week's
paper we will give Mr. Roeding's for-
mula for dry curing of olives. There
is demand with a certain trade for
fully ripe dried or, rather, cured olives,
and while it might not be wise for
the olive grower to cure in large quan-
tities without developing a market,
this method at least offers an open-
ing.

In the meantime may we not ask of
the state board of health considera-
tion of the question of disposal of a
few thousand tons of a fruit which
should be cared for and made into one
of the most healthful foods on earth.

Planning and Planting a Vineyard: Varieties

By Fred K. Howard

AFTER the land has been selected and you are sure of a dependable supply of good water, the next most important thing in the planning of a vineyard is the selection of the variety or varieties to grow. It is usually considered a safe plan to grow at least two varieties to prevent total loss in any one season through frost, rain or other factors over which the grower has no control.

The consideration of varieties is a very vital part of the undertaking and it is not to be expected that we can here definitely settle the question for every grower, as a variety which is admirably suited to one set of conditions might be absolutely out of the question in another locality. We can, however, give some facts and suggestions regarding the more common commercial varieties which it is hoped will be of material assistance to readers of the Cultivator who are planning to start in the vineyard business.

Your first decision will be whether or not you will grow grapes for the table market, for raisins, or the so-called wine varieties which are now being used very largely in bulk shipments to Eastern markets or are manufactured into grape syrup.

Wine Grapes

We will presume at this time that your inclination is toward the varieties which were used in the making of wines before the prohibition laws became effective. One must bear in mind that the market for these grapes in the fresh state may at any time be largely prevented by the federal government or at least so curtailed as to make their production unprofitable. There is, however, a perfectly legitimate outlet for these grapes, and probably always will be, in the form of California grape syrup. In a folder recently published by the California state department of agriculture the following statements regarding this product are made and prove interesting in this connection: "California grape syrup is as distinctive in character from other syrups as is pure maple syrup. The grapes from which it is made are the wine grape varieties which are now no longer used for wine

The Black Monukka

An early ripening practically seedless grape. This is a new dual purpose variety which may be used either for shipping or raisin making. Photo by Fred K. Howard.

making. These grapes produce highly colored red or golden hued white syrups and impart to them a special character and a distinctive flavor." The folder also enumerates several

uses for the syrup, among them being: Table syrup, to be used like jams, fruit butters, etc.; sweet dressings, to be used on puddings, jello dishes, etc.; also in the making up of soda fountain drinks. It is evident that from the apparent universal favor grape syrup has received that it will soon be on the market in large quantities, and the possibilities of using the wine grapes for this purpose should by all means be investigated by the prospective grower.

Table Grapes

When producing table grapes one of the most essential things to consider is the nearness to the market or shipping point and the present and possible condition of the roads. Grapes which are grown to be shipped fresh to Eastern markets should be handled as little and as carefully as possible. The grower should not plant table grapes in districts where there are no other shipping grapes unless he plans to produce enough himself to encourage buyers and shippers to purchase his fruit. A buyer will not ordi-

narily travel long distances to secure a crop of only a few crates of grapes.

The present varieties in most common use are the Flame Tokay, Malaga and Emperor. Among the other varieties which are planted in commercial quantities are the Cornichon, the Black Prince, Mission and Gros Colman. All of these varieties have their good and bad points and should be investigated carefully before planting, particularly with reference to the time of ripening, shipping qualities, and how they are received by the trade in the East. There are possibilities of developing some of the little known varieties particularly for late shipping. The Ohanez, or Almeria, grape has been suggested for this purpose and should lend itself to packing in sawdust as is done now to some extent with the Emperor. There is also a place for a variety which will ripen a little earlier than the Malaga and which is red or brownish in color. The Meriville de Malaga has been suggested for this purpose, and the Black Monukka is also receiving some attention. Both these grapes should be seriously considered. The representatives of the various fruit companies are always able and willing to give valuable information regarding the prices different varieties have commanded in the past and would also no doubt be able to give some hint of the prospects for the future. One very essential point in the production of table grapes should always be remembered. Do not attempt to grow the later ripening varieties in districts where early fall frosts are common.

Raisin Grapes

The choice of raisin grape varieties is not so large, but it is none the less very important. The Muscat of Alexandria, or the Muscat as it is commonly called, has always been the leading raisin grape in the state, but present tendency seems to indicate that the Thompson Seedless will soon pass it in numbers of acres planted. There will undoubtedly always be a good market for the Muscat either in the form of seeded raisins or in fancy clusters, but the soils suitable for its best development are unfortunately limited, as it must have a medium

(Continued on Page 759.)

Crop Insurance

By C. B. Messenger

THERE are insurance companies which will take any kind of a risk, not only of fire, life and health, but weather conditions, any loss which may come from unexpected turn of cold, rain, drouth or heat. For many years grain growers have insured standing crops from destruction by field or forest fires. Now comes crop insurance of another type, that is, insuring the crop against flood or other condition which prevents maturing of a full crop. Insurance companies have been taking such risks in Yolo and other nearby counties of the

Sacramento Valley. This enables the grain grower to invest largely in seed, equipment and labor to put in a crop of barley and know that if drouth prevails and the crop fails to mature he may still be protected from a total loss and have, perhaps, sufficient to begin another season's operations.

The cost of this insurance has varied with localities, seasons, capital owned by the insurer, his ability as a farmer and a number of other considerations. It may be as low as two and one-half or three per cent or it may be 12 per cent.

Orange growers have discussed the matter of insuring crop on the trees against injury from cold, and at one time the Lloyds had an agent in the Southern California field making investigations. The situation is such, however, that it requires an expert meteorologist with abundant data at hand to determine the probable conditions which may prevail in different localities. The final result has been that either the citrus grower has carried his own insurance merely by gambling on the weather or else by

fitting his orchard with orchard heating apparatus and stock of oils or distillates for an ordinary campaign.

The prune and apricot growers of the Santa Clara Valley have within the past two years carried to a limited extent insurance on their products after harvesting and while on trays.

Raisin makers of the San Joaquin and Sacramento Valleys have made a test during the past season, to a very limited extent, however, of insuring raisins, after being placed on the trays, against loss by rain or other weather conditions.

The importance of this has been

(Continued on Page 762.)

Agricultural News Notes of the Pacific Coast

Northern California

Petaluma, Sonoma County, produced 21,678,000 eggs, or 722,000 cases, between January 1 and October 1.

Sacramento Valley orchardists have begun their winter orchard cleanup spraying with lime-sulphur wash.

The annual meeting of the California Cattlemen will be held at San Francisco at the Palace Hotel, December 11.

Sacramento County farm bureau cow testing association has been re-organized. There will be a membership of about 600 cows.

President Walker of the state federation recently made address before the Butte County farm bureau urging affiliation with the state organization.

Taxpayers in Reclamation District 108 in Colusa County are protesting against exclusion of a large tract of 28,000 acres from assessment for costs.

The state railroad commission has placed valuation of \$37,000,000 on the properties of the Spring Valley Water Company which San Francisco is considering purchasing.

A two weeks' short course in pomology has just been finished at the university farm at Davis. Special attention was given to spraying, drying of fruit, and pruning.

The semi-annual meeting of the El Dorado-Amador Livestock Association, was held at Ione the last week in November. The next meeting will be held at Placerville, April 3.

Colusa County has produced some exceptionally fine crops of Indian corn during the past season. It has proven profitable and an extension of the planting is urged for another season.

Yolo County fat hog auction recently held at Woodland resulted in \$13.80 for high price on 204 pounders. Low prices were made by one bunch averaging 113 pounds and another averaging 363 pounds.

Declaring it an impossibility to continue paying high wages under present conditions in the rice fields the members of the Glenn County Rice Growers Association have reduced harvest wage scale.

There are now 562 students at the university farm school at Davis. Besides these there are 261 registered in short courses. Of the 562, 36 come from 19 other states and 22 of them from 11 foreign countries.

Former President Bertholdt of the Nurserymen's Association makes comparison of California prices of nursery stock with those of large Eastern nurseries showing that California prices are about half those of the Easterners.

The Central California Woolgrowers Association which has been composed mostly of sheep raisers of the Livermore Valley has decided to extend its scope of operation and invite sheep raisers of the San Joaquin and Sacramento Valleys to work with it.

Glenn and Colusa County people are incensed at the exaggerated stories of flood damage. A dispatch was received from the Red Cross in San Francisco asking if aid was needed. The break was at a pump hole which had been erected in the levee. A gang of 75 men soon had the break stopped. At its greatest length it was only about 100 feet.

Central California

Kings County farm bureau has re-elected J. W. Jenkins president.

A \$75,000 Japanese Buddhist temple was dedicated at Fresno last week.

The new cotton gin at Wasco is now handling new crop of long staple.

The Associated Raisin Company has made its final payment on the 1920 crop.

The California Associated Raisin Company now controls over 40 packing plants.

Tulare County orange shippers are availing themselves of state department inspection.

The recent rains gave nearly an inch precipitation in many sections of the San Joaquin Valley.

Prof. Condit is visiting fig sections of Merced County and encouraging production of finer output.

The Terra Bella farm center is discussing advisability of thorough winter irrigation of vineyards.

The California Peach and Fig Growers Association has bought the Hansen fruit packing plant at Fresno.

Turkey raisers at McFarland, Fresno County, report contracts for Christmas turkeys at 65 cents dressed.

The Milk Producers Association of Central California has decided to join the state body. The vote was 807 to 47.

Protest of Fresno residents against the erection of an undertaking establishment was favorably decided in the courts.

Prof. Flossfeder of the state university has been giving pruning demonstrations in San Joaquin County vineyards.

The Naval orange crop is moving out rapidly from the Porterville district. Growers report no trouble in getting sufficient help in harvesting.

Bean growers of Stanislaus County are thoroughly in sympathy with effort of the California Bean Growers Association to secure protective tariff.

The report of the California Associated Raisin Company for the crop handled in 1919 shows sale of 159,260 tons from which was received \$43,283,254.

From all over the state come protests against wanton destruction of Christmas berry trees. Several arrests are reported to have been made on private property.

The directors of the Tulare County farm bureau have raised the dues to \$7.50. This to cover the county expense only, local center expense to be carried by each center.

A Madera County farmer has succeeded in securing good price for his sweet sorghum by installing a small mill in the field, crushing and reducing the sweet sap to a syrup.

The railway commission reports development work carried on during the past year gives assurance that there will never be a similar shortage of power to that of the past season.

Manager Niswander of the Peach and Fig Growers has bought an old packing house near Fresno and will install a training school for fig packers. The school is to be opened this week with 30 girls under training. After sufficient training these girls will go as instructors to various packing houses over the valley.

Southern California

Imperial Valley is making shipments of its early ripening grapefruit.

Imperial Valley expects to plant many new vineyards the coming year.

Ventura County is protesting against the carrying away of her holly berries by the truck load.

Anaheim citrus growers shipped 593 cars from the association's packing house during 1920.

Honey producers of Hemet report receiving profitable prices for their honey this season.

Carload shipments of peas are being made to Eastern markets from Carlsbad, San Diego County.

A grape buyer in the Palo Verde Valley is offering a minimum price of \$50 a ton on a seven year contract.

San Diego County's first car of oranges left Escondido November 22, bound for Saskatoon, western Canada.

Banning almond growers have sent out several carloads of almonds and in spite of reduced price are getting very good return.

Southern counties are now conducting spraying demonstrations for peach blight and leaf curl, to be continued in spring as well.

The Riverside district has shipped 60 carloads of oranges for the holiday trade; the Arlington Growers Exchange has shipped out about 20.

The Alfalfa Growers Association of Imperial Valley held five meetings at as many points, the president and other officials from Los Angeles being present.

A large delegation of Eastern citrus fruit agents are now touring the orange districts of the South. They represented nearly a dozen states, and parts of Canada.

The citrus experiment station at Riverside has about 5,000 citrus hybrid seedlings in vigorous health and no doubt some new varieties of citrus may develop therefrom.

A very important meeting of cotton growers was held at El Centro, November 20, at which vexing matters pertaining to grading, prices and ginning were satisfactorily settled.

Owners of more than 1,000 acres formerly in beans in the Camarillo section of Ventura County have signed an agreement to grow beets, on account of the low price of beans.

Last year 1,400 machines for extracting orange juice were placed at soda fountains through the California Fruit Exchange; during the coming year they will place 10,000 more.

Failing to find a party who could satisfactorily attend to their spraying work, the members of the Valle Vista farm center of Riverside County have decided to form and operate a spraying company themselves.

The cotton growers, at their recent meeting in Los Angeles, entered a protest against any restriction of immigration that would cut off the alien cotton pickers from annual periods of residence on "this side of the line."

Until January 12 grape vines and cuttings from phylloxera free districts north of the Tehachapi will be admitted to southern counties under present regulations, after which date none may enter from any section north of Tehachapi.

The Coast and General

Stock shipments from Arizona are now very light.

Wenatchee Valley shipments of apples for 1920 will total 8,500 cars.

Hood River County, Oregon, leads the state in apples, having 10,446 acres.

Portland, Oregon, provides a daily glass of milk to 2,500 of its school children.

Eugene, Oregon, announces a marked shortage of nursery stock over all the Northwest.

The Yakima Valley, Washington, shipped over 1,300 cars of potatoes in 1920, at an average price of \$30 a ton.

California raised two-thirds of the fig yield of the United States in 1920 and 80 per cent of it came from three counties.

The annual meeting of the Western Fruit Jobbers Association will be held in Colorado Springs, Colorado, January 24-26.

Walla Walla County, Washington, crops for 1920 are estimated to be worth \$20,000,000. Wheat leads with estimate of \$11,000,000.

Yakima Valley, Washington, shipped but 6,000 cars of fruit this year, valued at \$7,000,000, as against 11,000 last year, valued at \$17,000,000.

One Kings County, Washington, horticulturist exhibits 50 varieties of apples, 28 varieties of pears, besides a varied assortment of grapes, nuts, etc.

The Washington Wheat Growers Association will send a representative to a meeting of the national farmers marketing bureau in Chicago about January 1.

Proposed change in rates and regulations governing diversion of fruit shipments has been suspended by the interstate commerce commission until March 31.

The 1920 egg laying contest in Washington gained first prize for Scott O. Holt, Auburn, with the year's return from five hens of eggs marketed to the value of \$54.76.

The steamer Marama left San Francisco last week carrying six cars of oranges, four cars of apples and a large consignment of lemons to Wellington, New Zealand.

Recent cold weather in Arizona is reported to have done no damage to olives; they are now being delivered to factories in good condition and practically all of the fruit is picked.

Local employment agents in Spokane say that there now are from 1,500 to 2,000 men idle in the city. It is hoped that the reopening of lumber operations with the first snows will improve conditions.

A special meeting of the executive committee of the Western States' Reclamation Association was held in Salt Lake City December 10. Reclamation specialists from 13 Western states comprise the committee. The chief discussion was on necessary reclamation legislation.

Special Assistant Nebeker to the Attorney General states that "Because farmers' cooperative organizations are exempt from application of anti-trust laws the department of justice had given no consideration to the campaign to withhold crops from the markets until prices advance."

Success on a Trapnest Foundation

By Jean A. Koethen

OVER the hill from the little village of Newhall in a green and purple rimmed basin which its fortunate inhabitants lovingly call Happy Valley is one of the best producing poultry ranches in the state. When we remember that the staff at Davis owns up to an average of only 120 eggs a year per hen and that the Poultry Producers of Southern California assumes the same average 172.5 eggs a year would seem to be "going some," yet that is what R. C. Gibson of Eggland Ranch secured from his hens last year, and he confided to me that he expects to do a little better this year. How does he do it? Production like this is no accident, we may be sure.

In the first place, Mr. Gibson is a young man with an ideal. His wagon, to use the Emersonian phrase, is hitched to a star. Success in poultry culture, he believes, lies in bettering the average. If a poultryman can worry along and make ends meet on an average of ten dozen eggs, every extra dozen he can secure means that much more labor income, and labor income means comfort now and something laid by for a rainy day. Fifty-two extra eggs in a year from each hen means over \$2 more labor income. A hen must eat whether she lay many eggs or few, and she must have a place to live in. Overhead and feed have been paid for by the first ten dozen. The last four dozen are clear profit.

When the Gibsons moved to Newhall six years ago it was in a search for rest and health for Mr. Gibson after a strenuous experience as salesman for a big millinery company. He had had a thorough business training, but knew nothing of poultry or any other kind of farming, except what he had learned in two years in an agricultural college long before. This was not the worst sort of equipment by any means. In fact a man with some idea of the principles of poultry husbandry fortified by the habit of keeping accounts has an excellent foundation to build on. "While I rested," he says, "my heart turned back to my first love—the desire to get a living from the soil. My years in college had taught me something about the possibilities of the land, and as I read the conviction grew that in no other way could as big an income be made from a limited piece of land as by poultry raising. I read everything I could get hold of, bought the most comprehensive works on poultry culture, such as Professor Dryden's book, Harry R. Lewis' Productive Poultry Husbandry, Professor Kaupp's volumes on diseases and management, and tried to master the principles of poultry husbandry right at the start. All authorities agreed that vigorous, highly productive stock is the foundation of success, and so I set to work to find the right kind of stock."

Trapnesting for Foundation Stock

It was evident that guessing would not answer in picking out foundation stock. Breeders must be producers of known quality, and only the trapnest could pick them out. The first year Mr. Gibson trapnested 225 pullets of five different strains. Most of them were discarded, but one lot proved to be remarkably good, and out of this lot the trapnest selected forty 200 egg hens. The cost of labor prevented a

continuation of trapnesting after two years, but the foundation had been laid. Nearly all of these forty hens are still laying at the end of four years, but most of them will go to market this fall. From them has been bred a line of cockerels that will perpetuate the fine production of their mothers, and hens of such remarkable fecundity that they merit

trapnest the first year and make sure of their foundation stock they will find it abundantly worth while. No man can predict how many eggs a hen will lay in a year. He can select by certain signs the hens that have laid heavily, but I doubt if a prolific strain can be built up without some trapnesting. If you begin with prolific hens the rest is easy.

A Restful Spot and a Profitable Poultry Ranch

Upper photo shows birdseye view of Eggland Ranch with the mountain rim of Happy Valley in the distance.

The middle picture shows some promising pullets. These pullets sleep in an open front house and spend their days in the shade of an oak. Such a house can be built now for \$30.

The bottom picture shows one of the Eggland laying houses. Note the wooden awning which may be swung at two angles from the hinge at top of the first board.

the title Mr. Gibson gives them—"super-layers." The present cockerel breeding pen contains 11 hens that averaged 255 eggs in their pullet year. The best layer ever produced on the ranch laid 292 eggs in a year, and the highest producer at present has a record of 287 eggs. One hen has just finished laying 58 eggs in 60 days.

A pen of ten hens from Eggland Ranch has been in the California farm bureau contest since last November and has held from first to third place the whole eight months. The week ending June 5 they stood third with 50 eggs, and the weeks ending June 12 and June 19 they stood first with 53 and 51 eggs respectively. "Tell beginners for me," urged Mr. Gibson, "that if they will just take time to

"The trapnest is the surest method of testing out all kinds of theories. It is also a great help in regulating the ration. One should study his chart daily. If a hen is lagging in production, it may be because she is too heavy, and again it may be because she is too thin. Handling her as she comes from the nest will show which is the case. If she is thin, a little more scratch grain will put her in laying condition, for a hen must have some reserve fat on her bones to be a steady producer."

Culling the Layers

Once the trapnested foundation has been secured, the layers may be culled from year to year, selection being made according to time of molting, color of shanks, beak and vent, and

especially in regard to vigor, for a hen that is lacking in vigor lacks the first requisite for long distance production. This stock is culled for vigor from the day it breaks the shell. Whenever a pullet begins to lag in development or shows any sign of weakness, out she goes. If examination shows that she lacks the deep keel and large girth about the abdomen so necessary in a high producer, or if she is not laying at seven months of age, out she goes. Selection for performance, however, begins about the first of July and continues through the summer. Every point that carries any weight in separating high producers from loafers is considered. "There's a girl that must go," Mr. Gibson pointed out, calling my attention to a pale shanked, pale beaked Leghorn lady, "and there's a doubtful one. Her beak is pale but her legs are yellow. This one, now, with the wilted comb and yellow legs, there is no doubt about her. That girl with the yellow beak, but her comb still red, she will lay a little longer. The hens with the yellow bands on their right legs have gone broody once. They never get more than one broody band. The second time out they go."

Pullets that mature early, say at five or six months, are banded with a red band. Every pullet that has passed the first year test, that is, has not gone broody more than once, nor molted before October nor stopped laying for any other reason before that time, receives the band that has been selected for designating the tested hens of that year. Some of the best hens in the flock are four years old, but whatever their age it is seen by a glance at the leg band.

When the culling is complete the hens are grouped in four classes: The first class consists of those that laid till December 1 before they stopped to molt; in the second class are those that laid till November 15 without stopping; in the third class those that laid till November 1, and in the fourth class those that laid till October 15. The hens of the first class are mated to cockerels from hens with a record of 240 to 280 eggs. This is the cockerel pen.

Double Yards

The six acres comprised in Eggland Ranch are carefully laid out on an elaborate double yard system. Instead of two yards to each house the four laying houses have four apiece, two in front and two at the rear. This is in order that any one of the four flocks in the house may have a yard by itself during the breeding season if it is desired. The houses hold each 300 hens, in four flocks of 75 each. The front yards are planted once a year to Sudan grass and the rear yards once a year to barley. On this very sandy soil a single yearly planting is deemed sufficient for sanitation. All laying houses are open front, facing east, with nests and mash hoppers along the front. Windows under the droppings boards and ventilators above provide circulation of air in hottest weather.

The brooder house is heated by hot water pipes, and accommodates 2,000 chicks in 20 runs 3 feet wide and 10 feet long. Portable runs are used outside. Not more than 100 chicks are kept in a single run and a smaller number is preferred. Only two hatches are run in a season, one com-

(Continued on Page 780.)

Top-Dressing Talk, No. 2

Fertilizing the Citrus Orchard

Both the scientific investigator and the practical grower indorse Arcadian Sulphate of Ammonia as the nitrogenous fertilizer for citrus.

The following is the opinion of the manager of the Fontana Farms Co., Mr. John R. Lupdimo, after very carefully testing Arcadian Sulphate of Ammonia in the citrus orchard:

"I candidly believe it to be true, that where one wishes to build up a poor soil into a fertile one and retain it under years of cropping, no better economical selection could be made of a nitrogenous fertilizer than Sulphate of Ammonia and home grown leguminous cover crops to plow under as a source of organic matter. The above combinations are the most essential ingredients required in most southern California citrus soils."

ARCADIAN

Sulphate of Ammonia

Arcadian is the nitrogenous top-dressing for all crops needing nitrogen. It contains 25 1/4% of ammonia guaranteed. It is all soluble, quickly available and non-leaching. Fine mechanical condition makes it easy to apply by hand or machine. Made in U. S. A. it is truly the Great American Ammoniate.

Arcadian is for sale by:

CUT DITCHING COST

THE Martin Way

No More Shoveling!

No more plows, slips, fresnos or "go-devils." The MARTIN makes the ditch from start to finish, any depth, up to 4 feet. It cleans old weed-grown and silt-filled ditches in jig time.

For Irrigation or Drainage

For small laterals or big ditches; for terracing, rice levees, alfalfa checks and borders and for road building. The MARTIN does the job.

For Horse or Tractor Use

This all-steel, adjustable and reversible implement is made in four sizes. It is sold in every state. Write today for big free catalog.

Time to Prune Vines

THE pruning of raisin grape vines is thus discussed by Richard Schmidt in the last issue of the Associated Grower:

It is often a question with the vineyardist as to when he should start the pruning of his grapes. One man will start pruning immediately after the leaves have fallen, another never begins until after New Year's and a third will wait until the sap begins to flow or the buds begin to swell. In ordinary years and under ordinary circumstances there would be but little difference in the crops of the vines pruned at these different times. Aside from the labor question it will make but little difference just when the pruning is done in normal years. Only in a few scattered cases is pruning done outside of the dormant season and these are in frosty sections.

There is some difference in crop and growth, however, depending on the time the pruning is done during the dormant season. The leaves of the vine feed the other parts, such as the canes, trunk, roots, etc., so that just before the leaves drop the canes are richest in plant food, which gradually diminishes and recedes into the roots, although some of the food again ascends into the canes to keep them alive during the dormant season.

So when vines are pruned immediately after the leaves have dropped, the cuttings made from the brush will be richest in plant food and best for propagation. However, in practice cuttings are usually not made so early in the season on account of the attention they require in keeping them until spring. Pruning vines before the leaves drop is detrimental to them on account of the removal of the leaves.

Some Effects

Vines pruned immediately after the leaves have fallen usually start to grow earlier in the spring. As a general rule the later the pruning is done, the later the buds will start. Those pruned in December and January, or at the time the majority of pruning is done in the state, will start

several days later than those pruned immediately after the leaves have fallen, while those pruned when the sap begins to flow will start still later, sometimes as much as ten days later. And when the pruning is done when the outer buds have started to grow, it may delay the lower buds from two to three weeks. In the spring a large portion of the food material in the roots is forced into the canes. So when the pruning is done at this time, this food material is lost to the vine, the latter becomes somewhat weaker in its growth and the fruit sets better.

Frost Precaution

There is no doubt that in frosty locations late pruning will often save the crop, provided the frost does not come too late, but it is a question whether the copious bleeding of the vine when cut after beginning to grow is not injurious. No doubt it is weakening, but with very vigorous vines the bleeding may be an advantage in reducing the growth and increasing the crop.

In actual practice the time of pruning will depend to a great extent upon the size of the vineyard and the number of pruners employed. All vineyardists know how difficult it is to get a good job of pruning done, and it is evident that the greater the number of pruners in a vineyard, the poorer are the chances for successful work. The more pruners there are the greater the number of poor ones. So, making use of the whole dormant season, pruning early until late, with the least possible number of pruners, should bring best results. The dormant season referred to would begin after all the leaves have dropped and end with the beginning of sap flow.

As stated above, the best time theoretically to make cuttings would be when they are most plentifully supplied with food material, such as immediately after the leaves have fallen; but as they can not be made until the vines are pruned, the making may have to be deferred until spring. It is best not to plant cuttings directly after making, but have them stored where they may callus if possible.

Larger Cooperation

WE ARE very much interested in the editorial in your November 20 issue, 'Cooperation in the Large,'

also the item on the opposite page under the head, 'Cooperation of Cooperators.' This is exactly the program which our general manager, Vernon Campbell, has been advocating for a number of years and which now promises to be developed to some extent at least; how far depending on the degree that the separate associations are willing to surrender their separate sales organizations.

This comment is from R. G. Spencer, organization manager for the California Cooperative Canneries, with headquarters at San Jose. We also note in a recent San Jose Mercury Herald an interview with Vernon Campbell, general manager of the Cooperative Canneries. Mr. Campbell remarked:

"Reestablishment of confidence in business and the solution of the marketing problem of this as well as of other states demands that the activities of the war finance corporation of the treasury department be resumed and that international trade be fostered by the direct exchange of commodities between different countries. An organization of the producers' associations of this state would do much to effect such a mutual exchange of commodities.

"The marketing of the present California fruit crop, and the probable difficulty of disposing of next season's crops, is intimately concerned with the export problems of the cotton and grain producers of the United States. This country normally produces three times as much cotton as it needs. At least two-thirds of our cotton must be exported.

"To restore confidence it is essential that our export problems be solved. Foreign exchange does not improve, and from present indica-

tion is not likely to in the immediate future. The exchange of our products directly with those countries ready and anxious to deal with us is the most sensible and businesslike proposal that I have yet heard recommended.

California's Opportunity

"We have in California 10 or 12 large cooperative organizations controlling products valued at over \$150,000,000. My suggestion is that these great organizations of producers combine for the purpose of exporting such of their products as can be marketed, especially throughout Europe, arranging to accept in return such products of the laboratories and factories of central Europe as are desired and can be readily absorbed by the trade in this country.

"For instance, a foreign country desires our dried fruits. We need from that country their dyes, inks, cutlery, scientific instruments, and other products which we are here unable to manufacture in the quantity or quality demanded. The exchange of our fruits for their supplies becomes the logical course of procedure.

"An organization composed of the various cooperative associations of this state would, in my opinion, be able to work out a plan for the exchange of products, thereby relieving us of our surplus, and at the same time opening up avenues of distribution for next year's crops."

CONTRABAND CITRUS STOCK DESTROYED

In accordance with the provisions of Quarantine Order 28 which forbids the entry into California "of all citrus fruits and citrus trees of every variety from any state or territory," Commissioner H. J. Ryan and his deputies, with the aid of local United States postoffices, has apprehended

and destroyed some 70 packages of Citrus trifoliata, grown at the U. S. Botanic Gardens, Washington, D. C., and mailed under frank of Congressman C. H. Randall to various persons in the county of Los Angeles.

More than 60 of the packages had been delivered and the larger part of the citrus nursery stock had been planted, but notwithstanding the almost Herculean task, Commissioner Ryan succeeded in tracing, locating, and without undue annoyance, destroying all of the trees.

As a phase of the proceedings, Congressman Randall and H. C. Needham of Newhall denied the right of a state officer to prohibit the entry of an interstate shipment, but the challenge was promptly set at rest by an opinion of the district attorney who upheld the state of California and Quarantine Order 28.

In the past the state has had to contend with a class of violations that fall largely under the head of "ignorance of the law," on the part of the malefactor; however, in this specific instance, the opposing parties hotly contested our right to keep the state free of disease, and insect pests, that have made other citrus growing states and districts unprofitable.

Thanks to the vigilance of our alert quarantine guardians and our quarantine code we have been spared a possible invasion of citrus plant pests and it goes without saying that mail shipments of nursery stock will pass redoubled scrutiny whether under the frank of representatives or otherwise. We admire Mr. Ryan's firm and vigorous attitude and his vigilance will also be appreciated by the representatives of California citrus industry.—G. H. H.

PLANNING AND PLANTING A VINEYARD: VARIETIES

(Continued from Page 755.)

heavy soil running from a sandy loam to a loam. In recent years it has been found that in spite of its very thin skin that it can be shipped successfully, and it therefore has made a place for itself as a dual purpose grape.

The Thompson will thrive on almost any soil. The old belief that this grape required a light sandy soil has now been largely exploded, as exceptionally heavy producing vineyards are to be found in adobe and "dry bog" soils. It will do better, however, on the light sandy soils than will almost any other grape, with the possible exception of the Zante currant. There is a general feeling in some districts that the planting of the Thompson being overdone. Only time will tell if this contention is true. We do know from past experience that salesmanship and advertising can do wonders in the marketing of California products. By the continuation and extension of the present sales and advertising program it will undoubtedly be possible to dispose of all the raisins of this variety that will be grown, at a fair price. The Sultana is now largely being replaced by the Thompson and is rarely ever considered when new acreage is planted. There are two other varieties which should be considered very seriously, the most promising one being the Zante currant. There are now about 250 acres planted to this grape in the state and there seems to be no logical reason why California should not produce at least enough of this variety to supply the already existing demand. This grape has much to commend it to the grower. First of all it ripens very early and dries very rapidly, thus enabling the grower who might also be producing the Muscat or Thompson to use the same trays and sweatboxes for both crops. The early ripening factor also practically eliminates all question of rain damage, which is such a large factor in the production of other varieties, especially the Muscat. Consideration should be given to the Black Monukka which was mentioned as a table grape above. This grape ripens early, is practically seedless, is larger than the Thompson and makes an excellent raisin. Unfortunately it will probably be several years before there will be sufficient cuttings of either the Zante currant or the Black Monukka to supply the demand, but it is safe to assume that these two varieties will be planted as rapidly as the available stock will permit.

MARKETING AVOCADOS

It is realized that a considerable quantity of avocados will be ripening next spring and summer, in small lots and scattered over a large territory. This phase of the industry was discussed at the last meeting of the directors of the California Avocado Association held in Pasadena, December 2 and will be one of the chief matters considered at the next meeting of the directorate.

The membership was reported as 373, a very pleasing steady growth. The committee on varieties reported favorably on a new one from Whittier shown at the last (Pasadena) convention, but it is still under observance and test. Two designs were shown of signs warning fruit thieves but definite action on them was postponed. Copy for the booklet of avocado recipes was approved and the same ordered printed at once. Resolutions of sympathy were adopted for the two members recently bereaved, Dr. Lester Kelier and J. M. Elliott. Preliminary arrangements looking to the spring meeting were considered and a few other matters of no importance to the public disposed of and the directors adjourned, to meet again in the near future.—E. B.

AGRICULTURE WORK IN NORWAY

F. W. Woll, professor of animal nutrition in the state college of agriculture, who returned today to the university after a six months' leave of absence spent in study and travel in England and Norway, in which latter country he received his early education, issued the following statement relative to conditions abroad:

"Labor conditions in both countries are unsettled by many strikes. However, the situation seems likely to improve, since the people more and more are coming to see that work alone can save the countries from the evils that followed in the wake of the world war. Limitation of the number of students admitted both in the elementary agricultural schools and in the college of agriculture was a striking feature of Norway's educational system. Rigid examinations held at the opening of the school year keep out half or two-thirds of those who apply."

SAILORS VIOLATE CITRUS QUARANTINE

L. E. French, state quarantine inspector at San Diego, in a report to Director Hecke recounts the following occurrence which should be of unusual interest to citrus growers as well as to all quarantine officers. Coincident with the arrival of a trainload of sailors in San Diego, from the Great Lakes naval training station, November 16, 1920, there appeared quantities of Florida oranges and orange peelings at the railway depot and along the tracks leading to the station.

Inquiry brought the information that the oranges were procured at the "Great Lakes training station and were issued to the sailors on the train in considerable quantities, the final issue being made at Oceanside. It appears that with the oranges instructions were issued by the officers—who admitted knowledge of the quarantine regulations—to throw all peelings and remnants out of the train before arrival at destination. The possible consequences of scattering such material along the tracks through a citrus country may be easily imagined.

Mr. French briefly reports: "It is needless to say that all the contraband fruit on the train was confiscated and the depot platform was carefully swept up and the fruit and peelings burned."—(L. A. S.)

ORDER TREES EARLY

The manager of one of the largest tree nurseries at Fresno said that 75 per cent of available orchard tree stock for 1920 was booked, not only in his establishment, but throughout the Central California district. Press notices of the outlook in Oregon and Washington show like conditions throughout the great Northwest. More recently southern dealers have reported the same probable shortage, not alone in deciduous but in evergreens and sub-tropical fruit trees and plants. He who would be assured of planting stock should order early or he may be forced to defer orchard extension for another year.

Home Made Olive Oil

By W. V. Cruess

In answer to question as to the manufacture of olive oil at home in our issue of November 9, we referred to an article formerly written for the Cultivator by Prof. Cruess and appearing in the Cultivator of January 4, 1919. As the disposition of surplus or waste product of the olive tree seems to be almost impossible today, this article may have renewed interest, so we repeat, especially in view of the fact that so many have written for copies of the former number that it is impossible to meet all these requests. The essential part of Prof. Cruess' original article is here given.

HERE is no thoroughly satisfactory way of making olive oil upon a very small scale without expensive machinery. The methods described below are the best that we have been able to find or devise for small scale use, but the yields of oil when compared with commercial factory yields are low. The necessary utensils can be found on any farm.

Extraction of Oil Without Pressure

A pound or two of ordinary lye, such as Babbitt's, Red Seal or Green-

badly stained and roughened by the lye and olive juice.

Place the pulp, which should now be of a pasty or mushy consistency, in a pot with about two or three times its own volume of water. Heat with stirring to the simmering point for about one-half hour. Set aside for several days to permit the oil to rise to the surface. Usually a fair yield of oil can be obtained by skimming it from the surface of the pulp. The pulp may then be heated to boiling a few minutes with more water and allowed to stand again. The process should be repeated several times. We have obtained about two-thirds the yield of oil by this process that can be obtained by use of a commercial press. The secret of success lies in rubbing the olive flesh to a fine grained pulp on a screen.

The oil obtained by this process must be washed and should be filtered as described later in the article. It has been found that the yield of oil is sometimes increased by adding about one-fourth pound of salt per gal-

Home-Made Olive Oil Press

Plan and drawing by Prof. W. V. Cruess. Specifications in Prof. Cruess' article.

bank's lye, will be needed. Make up a solution of the lye of one-half pound of the lye per gallon of water, using an agateware or iron pot. Do not use your aluminum ware; it will dissolve in the lye. A small basket of wire screen such as is used for making French fried potatoes will be needed, or a piece of cheese cloth can be used.

Heat the lye solution to boiling and while it is boiling dip the olives in it for about 20 seconds. The time will vary with the toughness of the skins. Leave the olives in the lye until the skins are softened; that is, practically dissolved. Then plunge them into cold water for a few seconds to check the action of the lye.

Place the lye treated olives on a piece of fly screen tacked to a frame over a large dishpan. Rub them on the screen until the flesh has separated from the pits and dropped through the screen into the pan. A heavy pair of gloves is useful in this process to prevent the hands becoming

lon of water used with the pulp. Always use a large excess of water with the pulp, as this facilitates separation of the oil.

Home Made Olive Press

A simple press made from materials usually found about the place is shown in the accompanying figure. This press has been described by F. B. Pinkus in the Olive Journal. The writer has made several modifications in the original plan of the press.

A, heavy wagon or automobile jack. B, small iron or steel cable or chain or heavy rope. C, two pieces 2x2x12 inches. D, shallow wooden water tight tray. E, heavy hurlap cloth to hold crushed fruit. F, floor of 2x12 inch material. G, 2x4 inch braces. The tray D and floor F are 16x16 inches.

One of the greatest difficulties will be the crushing of the fruit. This may be done as described for the method above. If this method is used,

A Big California Olive Oil Mill

Such a powerful mill and big press as is shown in the background is not possible in home making of olive oil but this illustration gives an idea of the industry as conducted in this state.

return the pits to the olives before pressing. The olives may also be crushed by placing them in a strong sack and hammering the sack with the broad side of an axe or with a heavy board in the same way that ice is crushed in a sack. The fruit must be thoroughly broken up. It will crush better if it is boiled a short time to soften it.

Place the crushed fruit and pits in a piece of heavy burlap and fold the edges of the burlap in to give a press cake about 10x10 inches and about four inches thick. Make two of these and place them in the press as shown in the figure. Press slowly until no more juice can be obtained. Save all juice and oil pressed from the fruit. The pressed pulp should now be boiled with an equal volume of water and pressed again. This pressed pulp should again be boiled and pressed. Usually a fourth heating and pressing will pay. Combine all of this pressed liquid and allow it to stand in a tub or barrel over night. The oil can then be skimmed off.

Washing the Oil

Oil obtained by either of the above methods will be bitter and not clear. It must be washed with water to remove the bitterness and rough flavor. To do this first prepare a bucket or five gallon can with a hole and faucet or cork near the bottom. Place the oil in this container and add an equal quantity or more of warm water. Mix oil and water by stirring for several minutes. Allow water to settle several hours. Draw off the water and replace it with fresh warm water. Stir; settle and draw off after several hours. Repeat until the oil no longer has a bitter taste. Usually two days washing will be sufficient.

Filtering the Oil

The oil will be cloudy and mixed with a little water. It can be made clear by filtration. A tin funnel can always be bought from the hardware store. One about seven inches in diameter is a convenient size. Filter paper can be bought from the drug store. Ask the druggist to fold the paper for you and tell you how to place it in the funnel.

Place the funnel in a wide mouthed bottle or place a 1x3 inch piece of wood over a bucket and bore a large hole in the wood to take the stem of the funnel easily. Pour the oil into the filter paper in the funnel and allow it to filter. Oil filters slowly; do not become discouraged if it requires several days for it to run through the filter.

Aging the Oil.

Olive oil is not fit to use as soon as it is made. It should be kept for at least one year before it can be expected to have the proper flavor. Keep it in well cleaned bottles away from bright light. Too much light will cause it to lose color and flavor. A warm room will cause it to age more rapidly. The oil will also age more rapidly if the bottles are only three-fourths full and if a small piece of cotton is used to close the bottle.

CROSS POLLINATION OF THE IMPERIAL PRUNE

By E. R. de Ong

The superiority of the Imperial prune, especially in size, makes it a desirable fruit for planting in most prune districts. This prune is, however, quite frequently a shy bearer as grown in California, hence any improvement by cross pollination is very important. The following observations made in Santa Clara County may be of interest in connection with this subject, bearing out the recommendations of Hendrickson in Bulletin 310 of the California experiment station.

The French and Imperial prunes have been experimented upon for years in this valley, especially near Gilroy, in the hope of securing better pollination. This experimental planting has not been as successful as desired. The failure has been attributed by some growers to the fact that the two varieties do not bloom quite as near together as would be necessary. The Robe de Sargent and Sugar prune are also acting, in a limited way, as pollinators for the Imperial. In most instances that have come under the observation of the author this type of planting has not been so much inten-

tional as accidental. In one orchard near Gilroy there are adjoining blocks of Imperials and Robe de Sargents. It is reported that for a period of years it has been necessary to thin the first four or five rows of Imperials adjoining the Robe de Sargents, while the remainder of the block sets a light or moderate crop.

This peculiarity has also been noted where the Sugar prune has been planted near Imperials. This combination of varieties may not always be so successful as in the instances mentioned, but at least it gives promise of being a valuable cross. New plantings are now being made in Santa Clara County on this principle, the Sugar and Imperial prunes being planted in alternating rows. It may be possible, judging from the observations made, that the Robe de Sargent may also prove a successful pollinator for the Imperial.

COMMITTEE FOR RAILROAD CONFERENCE

Pursuant to a resolution passed at the Fresno convention to the effect "that the director of agriculture for California appoint a committee, consisting of the executive heads of California marketing organizations in the fruit and vegetable industry, who shall be sent to Chicago in January to arrange with the railroads regarding 1921 refrigerator car service, so that it will facilitate rapid delivery, unloading and return of cars used in the transportation of California perishables, the following committee has been appointed by Director Hecke:

The committee consists of Charles E. Virden, chairman, president Virden Packing Company, chairman board of directors California Fruit Distributors; G. Harold Powell, general manager California Fruit Growers Exchange; J. L. Nagle, general manager California Fruit Exchange; Thomas O'Neil, president California Vegetable Union; Chas. M. Bentley, vice-president and sales manager California Packing Corporation; E. V. Foley, Fresno; J. M. Garcia, San Francisco; W. H. Stewart, president Stewart Fruit Company; A. B. Humphrey, Mayhew.

The resolution provides for a conference with the operating executives of the various railroads and their connecting lines, handling California perishables. It is hoped to secure regulations which will secure the unloading of all refrigerator cars within 72 hours after arrival, thus facilitating the movement of California perishables.

AN AVOCADO PEST

Wilson Popenoe found the worst avocado pest in Guatemala to be a small beetle of the curculio tribe infesting ripe fruits on the market. There is no external evidence of its presence but if an infested fruit is cut open the seed is found to be perforated by the larva. In some fruits examined the seeds were so greatly altered by the larva as to be practically sawdust. It is evident that fruit so attacked are useless. Luckily none of these beetles seem to have reached the United States.

TUOLUMNE COUNTY BEAUTIES

Horticultural Commissioner Sherard of Tuolumne County writes that the six plates of Tuolumne apples sent to the University of California to compete in the show conducted by the students in horticulture all took prizes.

We have had some Tuolumne County King Davids and know them to be the most magnificently colored and flavored apples we have ever tested. F. J. Ralph was winner of the King David and Winesap firsts and also took second on Delicious, and A. A. Beale took third on Rome Beauties. There were 1,000 plates of apples exhibited from various parts of California.

Surveyor General W. S. Kingsbury announces that on December 22 he will offer for sale 24,824 acres of state school lands in Mono County. The sale will be made in the Union League Building, Los Angeles, at 10:00 o'clock. The proceeds of the sale will go to the school fund. Anyone interested in the sale of this Mono County school ground should write to the surveyor general at Sacramento for further information.

The Miskin Scraper

IS

THE BEST SCRAPER ON EARTH

And we can prove it. Write for circulars

The above is a cut of the Famous Miskin Scraper, which in operation, easy draft, greater capacity, and better work has many advantages over the common Fresno and wheel scrapers now on the market and is guaranteed to take twice the dirt per trip with the same horsepower.

Made in 2-horse, 3-horse and 4-horse sizes. Can be operated by small tractors from the tractor seat by the tractor driver.

Send for descriptive circulars, with prices or ask your dealer to send for one on approval. We pay the freight.

KROGH PUMP AND MACHINERY COMPANY

147-159 Beale St., San Francisco, Cal.

Krogh Pumps are Absolutely Water Balanced

No End Thrust Possible

No Set Collars Used

The No Trouble Pump

Krogh Direct Motor Driven Pump

Fitted With Ring Oiling Bearings

Renewable Bab-bitted Bushings

Ring Oiling Gland

We also build deep well turbines, deep well plungers, horizontal and vertical pumps for mining, irrigation, drainage.

Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

Beet Growers Organize

The first steps toward permanent organization of the California Beet Growers Association were taken at Santa Ana on December 4, when a considerable acreage was signed for, to provide financial support. The agreement provides for an entrance fee of 50 cents an acre and a maintenance fee of 12½ cents an acre. A sufficient acreage was represented to insure a permanent organization, to be effected in the near future.

D. G. Goodwin of Huntington Park presided and G. A. Knapp of Garden Grove acted as secretary, being chairman and secretary, respectively, of the official committee elected to perfect the association. Farm Adviser Wahlberg of Orange County was the first speaker and presented the need of organization and the advantages which have followed other agricultural groups banded together. Even the provision and handling of labor would alone warrant the expense, for one grower was found who had paid \$3.75 per ton for topping beets. Jas. P. Britt, deputy state market director for Southern California, spoke of the great advantages derived through organization by the lettuce growers of Imperial and Coachella Valleys. M. Chumel of Tustin told of the experiences of the beet growers of Delta, Utah, who were offered \$10 a ton flat for their beets

and were advised against acceptance by the farm bureau. The next week the bureau perfected an organization and obtained a minimum flat rate of \$12 a ton with a sliding scale amendment.

G. B. Daniels, state market director, made a strong plea for organization and quoted statistics to show how numerous bodies obtained better prices as a whole than any individual grower had obtained previously. One local organization referred to was the Los Angeles poultrymen. They were at the mercy of the large buyers, with deplorable results. Now the New York buyers flock to them, buy and pay for poultry on the spot and without examination of same, all accomplished through proper organization. "Find out, collectively, what you should have for your crop. The individual cannot do it, cannot afford investigation by an expert. As a unit you can." He promised all the aid his office could legally extend to the new organization.

The committee in charge will now hold meetings in every beet growing district of the South within a week or two, to culminate in one big central meeting to elect officers, adopt constitution, by-laws, etc. It is believed that 20,000 local acres may be signed for by the New Year and that a like acreage from farther north will soon be added.—E. B.

CROP INSURANCE

(Continued from Page 759.)

considered so great by officials of the association that a special insurance department has been organized and placed in charge of Frank Schofield, a practical insurance man. There has as yet been no effort whatever at making this a mutual plan insurance. An old line company has been chosen. As a foundation the base sweatbox price has prevailed. The grower must carry the first 15 per cent of his loss, that is, if the sweatbox price is \$300 per ton and the fruit is injured only to the extent of \$45 per ton, the grower can recover none of this loss, but if the loss amounts to, say, \$100 per ton, then he collects \$55 on each ton which was damaged. Presumably this is a provision insisted upon by the insurance people in order to insure greatest effort on the part of the insurer to protect his crop when there is danger of loss.

The cost of this insurance is two per cent in the case of Thompson Seedless and 2¼ with Muscats. This difference is because of the fact that Thompsons being an earlier grape dry more quickly and are sooner removed from possibility of weather injury.

The matter of the cost of the insurance, the percentage of the loss to be paid and many other features are yet to be worked out. It is a new field with no precedents to turn to. The movement has not been so generally accepted in the San Joaquin as in the Sacramento Valley where the probability of rain is greater. In order to be entirely safe one provision is made which it appeals to us is hardly fair and will probably be somewhat changed, and that is this, that where, say, a half the crop of any one grower has been harvested and the other half is seriously damaged by rain the 15 per cent which it is insisted that the grower carry covers the entire crop, both the harvested and yet-on-the-tray portion. That is, if \$1,000 worth of fruit is out and suffers 100 per cent loss, the 15 per cent is deducted from both the \$1,000 worth of fruit which is lost and from the \$1,000 which had been harvested, or a total of \$300 charged up to the grower and \$700 only paid to him. At first spreading on paper was not permitted, but at present where 80 per cent of the fruit is on trays 20 per cent may be spread on paper.

Table grape growers are likewise considering the possibilities of this insurance. Growers of other fruits and crops are constantly inquiring, and we believe it is a safety first step which may come into more general use and perhaps save many a grower from complete ruin in time of these heavy losses.

Whether it can be worked cooperatively, as fire insurance is so successfully now, is, perhaps, a question.

Nor is California alone in this matter of crop insurance. New York state potato growers are testing it out. We note in a recent Rural New Yorker the following:

"A number of our readers have been interested in reports of insurance for the potato crop. Several of them want to know if they can insure their next year's crop at once. We have obtained a statement from the insurance company which did most of this work last year. They tell us that most of their insurance was written in the South. The rates have varied all the way from three per cent to 12 per cent, depending on the risk involved. That risk would be determined by the locality, the liability to frost or disease and the general character of the potato grower. In the district of northern New Jersey, or near New York City, an allowance of \$200 per acre was permitted. In some of the farm districts of Maine \$250 per acre was given. This insurance guarantees a certain income from an acre of potatoes, and under the conditions the grower contracts to perform his work in a certain way. He must use high class seed, and use a certain amount of high grade fertilizer. The soil must be in a first class condition and cultivated properly. As part of his contract, the grower agrees to do these things, and he would naturally forfeit his interest if he did not live up to the contract.

"Last spring the insurance was figured on the basis of a high potato price. After the slump this fall it is

likely that the insurance companies will meet some heavy losses. Last spring many of the growers felt that the six per cent premium was too large. As prices have turned out it is evident that the insurance companies did not make any money at such a premium. The company is not ready now to insure for next year. It is probable, however, that when spring comes they will be prepared to insure the crop in much the same way. They may make a change in the method of figuring the income from an acre. In some speculative crops their offer would probably be to insure a certain yield at a stated figure, rather than to insure a certain amount of income. Naturally it will be impossible to figure out the risk properly until later in the season, when the prices of seed, fertilizer and implements can be worked out.

"It is evident that this plan of insuring crops is to develop. This insurance acts both as a protection and credit. If the farmer can insure his crop with a reliable company he is reasonably sure of a certain income from that crop, and with such insurance he would be more likely to obtain fair credit from a bank or money lender than he otherwise would be. Sometimes this is a matter that must be figured out with great care, so as to make a fair proposition for both sides. We have asked the insurance company if they would be willing to grant insurance on an outfit of fruit trees. Can we make arrangements to insure against misfits from the nursery? This matter has been up several times in the past, but formerly insurance companies were not disposed to take hold of it. Now that the potato crop is being insured, they feel that it might be possible to work out some protection for the fruit grower. It would mean considerable risk and a long time investment, as it might be some years before the trees could come in bearing to prove whether they were true or not. We think it likely that in the future farm insurance of this sort will be worked out. In such a case the character of the nurseryman would have to be considered, and some form of guarantee on his part would be demanded. This side of the business, however, is developing, and there seems no reason why in the future the farmer should not be able to insure his growing crop in much the same way as a merchant can insure his stock of goods."

POSSIBLE QUARANTINE OF POTATOES

Oregon potato growers, or at least her state board of horticulture, do not relish possible introduction of tuber moth. The tuber moth has been in a very few sections of California for many years and has not been a serious pest, and the potato growing industry has increased in spite of any such handicap. However, none of our growers can blame a state for taking any precaution which may prove of help in keeping out such a pest. To that end California growers and horticultural commissioners have taken greatest care in exporting pest free products. The Oregon state board of horticulture now calls for a conference as to the best steps to take in keeping her state free from the pest. The public hearing will be at 10 o'clock, December 14, at Salem, Oregon. Director Hecke is giving information as to this meeting in order that California growers may be present should they so desire.

STEAM COOKED PEANUTS

A recent issue of the Journal of the American Medical Association states: "When fed to healthy young men, steam cooked peanuts were found to be well utilized, the carbohydrates in the entire diet in which legumes formed a prominent part being 99 per cent digested in the case of the peanuts. The average digestibility of the peanut protein was 92.8 per cent.

"The fact that large quantities of peanuts were consumed daily for three successive days without causing any physiological disturbances indicates that this food cooked for two hours by steam at 15 pounds pressure is well tolerated by the human body. It is concluded that peanuts are specially valuable for human food as compared with other legumes which have been studied with the same thoroughness."

FRESNO, CALIFORNIA

Legal Queries

Louis B. Stanton, attorney 243 Wilcox building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Luxury Tax

A suit of underwear cost \$7.50. The clerk required an additional payment of 25 cents tax. Was this legal?—Subscriber, Red Bluff.

Under the federal internal revenue act it is provided that after May 1, 1919, there be collected and paid a tax equivalent to ten per cent of the amount paid in excess of \$5 each upon underwear.

Wife's Property

Is the wife's second husband entitled to mortgage the wife's cattle which the first husband's children gave her? May the wife sell such cattle?—Subscriber, Jamestown.

These cattle were a part of the wife's separate estate by reason of the gift made of them and the wife is the sole owner. She may, therefore, sell or mortgage them without the signature of the husband and the husband is not entitled to either sell or mortgage any of them.

Olographic Will

If I write my will in my own handwriting, dated when and where written, sign it in my own writing, and have no witnesses thereto, is such a will legal?—Subscriber, Sierra Madre.

Such will is known as an olographic will and is entirely legal. Care should be taken that the date is written in full and not by figures.

Deed Instead of Will

If I make a deed to certain property and deliver this deed to my agent or to the person to whom the property is deeded and I die before the deed is recorded, will such a deed convey the title to the property?—Subscriber, Sierra Madre.

If deed is properly executed and delivered to the grantee it will convey the title to the property even though it is not recorded, but if it is delivered to the agent of the grantor so that the grantor possesses any right to withdraw, such deed is not a delivery of the deed and the conveyance will be invalid.

Separate Property

The husband loans money, which is his own property; note evidencing loan and mortgage to secure it made to himself and wife. Is this community property or partnership property?—Subscriber, Sierra Madre.

In such case, by reason of the instrument reciting the names of both husband and wife as payees, a presumption might arise that each have an undivided interest in the money by reason of a presumed gift, or it may be deemed that the husband intended to mingle his separate estate together with the community estate and transform it into community property. The circumstances and facts of each particular case would govern in the matter and it is possible that no change whatever in the character of the separate property would be worked.

Assessment in Irrigation District

Is there any statute defining the mode of assessment of land in an irrigation district for the raising of taxes in the district? Can land be assessed at different values depending on its location with relation to any given city or must all land be taxed alike?—Subscriber, Oakdale.

The general irrigation district act provides that the assessor of the dis-

trict between the first Monday of March and the first Monday of June of each year must assess all real estate in the district at its full cash value, with the exception that the improvements are exempt from taxation of the district, the word "improvements" including trees, crops, buildings, or structures. In case the district assessor fails to perform his duties, then the assessment made by the county assessor of the county wherein the property is situated shall be taken as the basis of assessment for the district and the board of supervisors shall upon such basis cause the assessment roll and tax levy to be made. As land ordinarily differs in its valuation in accordance with its proximity to markets, it is probable the injunction of the law to assess at its full cash value would necessitate higher values on land located near a market place than that which is remote therefrom.

Lease of Rice Land

I leased land for raising rice from 1916 to 1919. The lease provides that the lessee will remove all willows, water grass and tules. Failing to do so, the lessor at the expense of the lessee may remove such growth. The weeds were not removed during the term of the lease. Has the lessor a right for an action of damages?—Subscriber, Santa Maria.

It will probably be necessary to examine the lease as a whole to determine just whether or not the lessor would have such action, but it is very probable he would be entitled to his damages for the cost and expense of clearing the land of the weeds together with such damage as he could show that the land had suffered by reason of such weeds being permitted to develop thereon.

Community Property

Twenty-five years ago my husband and I were married and since that time have acquired some property and a business. I have inherited some money and have placed this in the business. As time has passed my husband has developed a very high temper. Can I go and come from home at any time? Could he sell the place or any of the stock and do I have the same right as a partner in property and as such could I sell the place and stock?—Subscriber, Bloomville.

Except as to the property which you have inherited, the business and other property is community. Of such property the husband has the management and control, with absolute power of disposition as of his separate estate, provided that he cannot dispose of it without a valuable consideration; he cannot sell, convey, or incur the furniture, furnishings, or fittings of the home without the written consent of the wife. The wife would not have the right to dispose of the community personal property such as has the husband. As to the real property, the sale or incumbrance thereof cannot be made without the signature of both husband and wife unless the title stands in the name of the husband and such disposition is made to an innocent purchaser without knowledge of the marriage relation. In any case, action must be taken by the wife in one year from the recording of the instrument in order to set it aside. The relations of community property of husband and wife are entirely different from the legal relation of partnership, and in order to have the rights of a partner it would be necessary to show that there was an actual contract of partnership, the presumption being there is not in the case of husband and wife.

Annual of Farm Bureau

Los Angeles County's farm bureau now numbers over 2,200 regular members. The dues still stand at \$1, but in order to meet the demands of the state association and the national federation an assessment of \$1.50 has been made. Officers elected for the coming year are: President, Robert H. Neely; first vice president, Harry S. Bissell; second vice president, Dr. J. B. Biller; secretary, W. S. Rosecrans; treasurer, Ralph McNees. Other directors are Volney H. Craig, J. B. Vaile and Dr. Geo. P. Clements. Representative to the state federation, Volney H. Craig.

The recent annual meeting was held in the grounds of Santa Anita Rancho, less than a dozen miles from Los Angeles. The principal features were an address by B. H. Crocherson, director of agricultural extension of the university, and the regular annual by retiring President J. B. Vaile. President Vaile has just returned from tour of the East, especially a visit to the farm bureau headquarters at Washington, D. C. Experiences of his visit and methods followed by many of the Eastern farm bureaus made his address one of particular value to the California counties.

The afternoon program was largely given up to demonstrations of characteristic extension service-farm bureau activities. To give an idea of the livestock work a visit was made to the Santa Anita dairy barns where demonstrations were given in testing milk, the actual testing being shown by cow testers who are now handling the farm bureau test of 3,500 cows monthly. Another feature of the day was the awarding of medals for the first five months of the dairy cow competition. This competition will be continued until June 30, a number of medals being awarded meantime, and at the completion of the competition awards will be

made of a large number of silver cups. Then there were pruning and other demonstrations, making the day one of great value to the members as well as one of recreation and pleasure. The noon luncheon was under Santa Anita's great oaks.

The potato growers department of the farm bureau is becoming one of great value. T. H. Lambert is director of the department and he had made a call for a gathering at the annual meeting of all the potato growers. The attendance was liberal, and the following program was laid down for 1921: 1, membership campaign, the members to be increased because of the need for the moral force of a large membership and the support to the movements outlined below. 2, test potato plots, that is, working with the farm adviser and experts of the university in the matter of better varieties, fertilizer plots, i. e., determining as to whether commercial fertilizers yield results justifying their application. It is desired that more exact check shall be made on cost of fertilizing and returns secured. Connected with this will be a campaign to induce more liberal planting of cover or green manure crops. Another feature of the campaign will be seed selection, including certification and use of only highest grade hill selected seed. 3, standardization, and marketing methods to be improved. To secure best results in this division of the work a series of night meetings is to be arranged, with discussions as to what the California standard shall include, or as to whether U. S. No. 1 shall be adopted. 4, continuation of spring and fall crop observation tours.

One feature of the morning session was the annual meeting of the home department. This meeting was in charge of Director at Large Mrs. J. L. Colwell, with Mrs. L. D. Doan as county chairman. This department is especially active and has prepared a program for the next year which will add materially to the strength of the county organization.

What will your land be worth 5 years from now?

Every crop harvested takes just that much nourishment and vitality from your soil. Unless these vital elements are replaced your land will decrease in fertility and value.

AGRI Gypsum refreshes and revitalizes the soil—makes possible more and better crops—increases the value of your land year by year.

AGRI Gypsum gives efficient fertilization at low cost. For each \$1.00 invested in it many dollars will be returned.

AGRI Gypsum is a specially selected, specially ground and specially prepared Gypsum rock.

A poor agricultural gypsum is not of much benefit; AGRI Gypsum is a remarkable fertilizer.

"RED TOP" STEEL FENCE POSTS

America's Foremost
Fence Post

The "Red Top" Steel Fence Posts have earned the right to be known as the world's foremost fence post.

Millions of these permanent steel fence posts have been installed on Government property, along the right-of-way of leading railroads and on thousands of America's best farms.

The "Red Top" has answered the every requirement of the three general classes of post users. It has given continuous satisfactory service under most adverse conditions and in each case it has made good.

Natural enough that today it is recognized as the world's standard fence post.

Know this superior steel fence post. Identify it by the "RED TOP."

"Red Top" Fence Posts drive like a stake—Anchor like a rock—no concrete used for line posts.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Cottonwood Windbreak

I am considering cottonwood for a windbreak across my 120 acres. Please answer the following. Do cottonwoods encourage aphids? How can male and female trees be told after the lint or cotton is gone? Are there any objections to planting cottonwood in California? Which grows the fastest, cottonwood or balm of Gilead? Which requires the most water?—Subscriber, Lathrop.

So far as we know cottonwoods do not encourage aphids. The male and female cannot be told apart when not in bloom or seed. In proper season the males should be marked and cuttings taken from them as the "cotton" clusters about the seeds. There are no objections, legal or otherwise, to the planting of cottonwoods. The growth of both cottonwood and balm of Gilead are rapid and both depend on water supply. The "balm" is the handsomer tree and is male only, so produces no cotton. It is a garden hybrid and not a wild species. All are easily grown in any size of cuttings, from twigs to fence posts.

Butter Coloring

Could you give me a recipe for making a good butter coloring at home? An eight ounce bottle costs us \$1.35 at the store and I think they make it and put it in plain bottles and label with a lead pencil. The same bottle used to be 50 cents.—Subscriber, Chlco.

Have any of our subscribers any suggestions along this line? We note in Lippincott's "Productive Dairying": "Coloring the butter is accomplished by adding the liquid color to the cream immediately before starting to churn. The quantity used will vary with the breed of cattle, the feed that they are consuming and the market to which the butter is to be shipped. Generally speaking, one cubic centimeter of color for every pound of butter fat in the cream, or one teaspoon for every gallon of cream will be found abundant. Some colors are stronger than others and care must be exercised to not use too much. The market requirements should also be studied. The color used is the outer portion of the seed of the annatto plant which grows in the South Sea Islands and South America. The color is incorporated mechanically in cottonseed oil as a carrier. When used, the added color accompanies the oil and is made to surround the many globules of fat. Butter color is used for the purpose of maintaining a reasonable degree of uniformity in color throughout the entire year or, in other words, to make butter look like butter, the year round, not like butter in summer and lard in winter."

Woolly Aphids

Please tell me what is the matter with apple tree that has white growth on limbs that looks like cotton? Is there any spray to use and if so when?—Subscriber, Orange.

This is doubtless woolly aphids, one of the most serious pests of the apple. Essig's "Injurious and Beneficial Insects" says: "To the average orchardist this insect is of too common occurrence to need any suggestions for its identification. The dark red or purplish louse covered with the long white cottony wax or flocculence is the most serious apple pest in many of the northern counties. The winged forms are distinguishable by their dusky protruding wings. The fall and early winter lice are dark yellowish or brown in color." The portion of the pest which is seen on the trunks of trees is only an indication of its worst form which is working on the roots. At this period of the year especially their worst work is being done underneath the surface of the ground. They are known to have followed down the roots to a depth of ten inches in the ground. For this some remove the earth to a depth of six or seven inches and out from the trunk of the trees two or three feet and

sprinkle the roots and ground with liberal application of a spray made up of water and 40 per cent nicotine sulphate. Proportions are given on the package, but they are approximately about one ounce to four gallons. As soon as liquid has soaked in fill up the basin. The best spray for the form which is on the trunk of the tree is nicotine sulphate three-fourths ounce, ordinary laundry soap four ounces, water four gallons. Dissolve soap in hot or boiling water and add the nicotine.

Winter Pasture for Pigs

What could be planted now that would make a good winter pasture for pigs? I was thinking of barley or clover. Would clover get large enough for pasture if planted now? Is it too late to plant alfalfa, and if not, how late can it be planted?—Subscriber, Strathmore.

It is rather too late to get best of success with sweet clover, alfalfa or the vetches. This late we believe we would plant rape which would give the quickest return when ground is as cold as it is now. This is a winter grower and is especially fine for pigs. Second choice would be a good stock beet. They will be ready to feed to pigs in about three months but would not afford the immediate pasture which would be given by the rape. Any good stock beet will answer but one known as Half Sugar is highly recommended. Excepting in protected section near the coast or at least where conditions are generally warm and there is no danger from frost, there will be more chance with the clovers or alfalfa. Alfalfa may be planted in February or March according to lateness of spring frosts.

Fruits in Family Orchard

Kindly give me a list of about 100 trees of mixed fruits that would make a good family orchard; fruits good for eating as well as canning. This orchard is to be planted at Atascadero, San Luis Obispo County, on gently sloping ground.—Subscriber, Byron.

This is a matter of personal, or rather family, taste. For instance, if the one who is endeavoring to answer this question should have the choosing of such an orchard for his own use the fruits set would nearly all be of some variety of peaches. This might not be at all satisfactory to the family which is asking the above question. Therefore we would suggest an "evening session" with a bunch of nursery catalogs. Some of the very best nurserymen on the Pacific Coast are carrying their ads in the columns of the Cultivator. A post card request to any of these or perhaps all of them will result in a copy of their annual catalog. Then we would start, say, with peaches, beginning with Briggs Red May and the description of that would probably be something like this: "Greenish white, with red cheek; flesh white. Recognized market variety. Ripens middle of June." It is very probable that we would recall that this peach is not of very high quality. It is rather watery, not exceptionally sweet and yet "middle of June" would mean quite an early peach so if we wished the peaches to cover the season we might try one or two trees of this variety. Amongst other early ones there is the Alexander, a larger peach said to be a standard shipping sort, and another is the Admiral Dewey, or sometimes called Triumph. Then there is the Early Imperial, the Mayflower and the Greensboro, "among the earliest and largest. A wonderfully vigorous grower. Ripens May 1." This seems most too good to be true but would plant at least one of that variety. Then come the July ripeners, including the Australian Sauter, Blood Cling, Foster, Elberta, Hale's Early, Muir, and Tuscan Cling. Amongst the August ripeners are some of the best canners, and with the Elberta, Foster and other better July peaches will make the bulk of the freestone canners. Some of the August ripening varieties are Crosby, Late Crawford, Lovell ("leads all other clear yellow freestones"), McDevitt's Cling, McKevitt's Cling, Philip's Cling, Sellers' Orange Cling,

Slm's Cling. Then amongst the September and even October ripening varieties are the George's Late Cling, Heath Cling, Levey's Late, Picquet's Late and Salway. Of the above one could vary to suit his taste but as a personal suggestion the writer would want but few, if any, of the cling peaches where they are planted for home use. Others might plant even a greater number of the clings than they would of the freestones. Then one would want a half a dozen or more of plums, a few nut trees, especially almond which should do well in the San Luis Obispo County section, probably a few summer or early fall apples, several Bartlett pear trees, at least two or three apricots, two or three figs, a couple of rows of small fruits, a nectarine or two, a few olives, and if one likes persimmons two or three varieties of that fruit.

Naturally every California orchard will want citrus fruits. Of these there might be a dozen, or even a hundred and have no two trees of the same variety. If locality permits avocados should be planted, but even to give a list of all other sub-tropical plants which would add to the joy and comfort of the family would take another column.

Birds in Enclosure

A subscriber recently asked as to keeping pheasants or other birds and breeding to supply the table or for disposal in market. The question was referred to the state fish and game commission which answers:

The game laws provide for the raising of game birds in captivity under what is known as a game breeders license, for which the annual fee is \$2.50. These licenses are issued to all applicants in good faith who can comply with the simple requirements of the law. The requirement is that the preserve must be wholly enclosed, and this anyone penning up birds automatically complies with. Breeding stock can be obtained from licensed game breeders. On or before the first day of January of each year every person having license shall make report to the fish and game commission as to number of game birds or mammals killed, sold or transported.

Cultivate Morning Glory

There are chemicals which will kill weeds, and it is possible that the chemical may yet be found which will do this work and not ruin the soil for other crops. However, as yet it appears that the cultivator and the hoe afford the safest and most economical means of disposal of this weed. We recently referred to the campaign conducted by Ventura County, which called forth the query as to the method, so we wrote County Commissioner H. H. Call regarding methods and he writes:

"Relative to control of morning glory in Ventura County would say that we have carried on numerous experiments with chemicals, principally sodium arsenite. At times we have had fair success with this chemical under very favorable weather and soil conditions, but the best method of control of this pest is clean cultivation. This is hardly practical on a large area, but on small areas running over the ground with either a weed knife or cyclone every five days for a period of two years, cutting the weed at least two inches under the ground, will completely eradicate this pest. Unless this system is systematically followed up the weed can not be cleaned up."

Leaking Milk

A question was asked in recent Cultivator as to how to prevent leaking of milk from cow's udder. A. C. Pickett of Riverside writes: "Try small rubber bands around the teats."

This sounds as if it might mean much discomfort to the cow, but we take it this calls for use of judgment in not having the bands too tight.

Does Eucalyptus Improve Soil?

In a recent issue of your paper a subscriber from San Diego inquires about the best method of restoring soil that had been occupied by eucalyptus trees. The soil needs no restoration as the trees have taken nothing from the soil but rather added

to its fertility. Forests never impoverish the soil. Some years ago I pulled out eucalyptus trees 30 years old and planted apricots in their place the same season. The trees are larger and healthier there than those on the same kind of soil, right alongside, where nothing had been grown before. —T. O. Thompson.

Perhaps Mr. Thompson is right. We would prefer to give thorough fertilization and preparation of such soil. Of course when deciduous forest trees have deposited their leaves for centuries a soil filled with humus is produced and it is wonderfully productive. Naturally, the large roots have opened up air passages to lower levels and aeration has proved beneficial. In any case those apricot trees talk louder than we can.

Lippia Turns Brown

Last April we planted some lippia for a lawn. It grew nicely until the cold weather set in, and now it is dying out in places. The soil is a sandy loam and it has been irrigated freely. Would ground bone meal help any? If not, what can I do to save it?—Subscriber, Del Mar.

We think this is merely a case of cold weather. Lippia does best and keeps greenest in the hotter months.

We imagine that with the coming spring, if not tramped too severely, this lippia will be one mass of bloom and green leaves. Again, it is barely possible it is where it has been tramped severely during the fall months, which has worn it down and given the brownish appearance. However, examine carefully and see if healthful conditions obtain at the roots. Again, it is possible that the dried blossoms of the last season are still there and they will give this brown appearance. Run over the lippia with lawn mower the same as with blue grass.

Berries in General

We have seen so many helpful answers to other people's questions, we are going to try some of our own. We expect to go into the berry raising business on a small scale and would like to find out which is the best variety of blackberry, logan, raspberry, gooseberry and strawberry. What can you tell us about the thornless blackberry? Is it a success? Is it set out and cared for the same as common blackberry?—L. S., Dinuba.

While the old and well known Crandall blackberry is still extensively planted, the Mammoth strains are growing in popularity and of these Corey's Thornless is the strongest

favorite. It requires same care as the others. In some districts Himalaya is the leading variety. In raspberries St. Regis is leading the old standard Cuthbert because of heavy bearing the first year. Both are good. There is but one loganberry, though the Phenomenal is considered a black logan. Gooseberries are an uncertain crop and we advise ascertaining if they thrive in your immediate neighborhood. This is also true as to the better varieties of strawberries. Throughout the state at least a dozen varieties are leaders in their respective districts. Find which one or ones do best in your locality in soil and under conditions similar to those of your ranch.—E. B.

POTATOES "RUNNING OUT"

Exhaustive experiments have been made at the Minnesota experiment station in hill selection of potato varieties that were "running out" with a view to selecting strains resistant to degeneration. The experiments ended in total failure so far as finding resistant strains or even individual hills. High and low yielding hills and tubers gave same results, low yielding hills often giving the better results. After a variety starts to "run out" in a district it is better to discard it and grow some other.

SUCCESS

OXY-ACETYLENE WELDING

We cannot begin to supply the demand for qualified oxy-acetylene welders. A great many of our students after completing this course, go into business for themselves.

TIRE VULCANIZING

In the Modern Auto & Tractor Schools, the student learns both the theory and practice, while doing the actual work, on the best equipment obtainable.

SUCCESS—OR FAILURE?

Sooner or later you will make a decision. It may seem unimportant at the time you make it, but just as surely as night follows day it will affect your whole life.

Decide today that you will be successful. Success is certain to the man of purpose. Make your purpose the gaining of that specialized, technical knowledge for which the world eagerly waits—and your success is assured.

The Contributions of Science

The greatest material benefits the world has received have come from the laboratories of the scientists. They create the means for accomplishing the seemingly impossible.

Science, after years of labor, produced the telephone. From a feeble instrument capable of carrying speech but a few feet, science continued its work until now the telephone-voice may be heard across the continent.

In February of 1881 a blizzard swept the city of Boston, tearing from the roof of the Bell telephone building a vast net-work of 2,400 wires. It

was the worst wire disaster the Company had sustained.

Now through the advance of science that number of wires would be carried in a single underground cable no larger than a man's wrist.

As the fruit of the effort of science greater safety and greater savings in time, money and materials are constantly resulting.

And never before as now, the scientist is helping us solve our great problems of providing Telephone service that meets the increased demands with greater speed and greater certainty.

HOW HE DIED

So he died for his faith. That is fine,
More than most of us do.
But stay, can you add to that line
That he lived for it, too?

It is easy to die. Men have died
For a wish or a whim—
For bravado or passion or pride.
Was it harder for him?

But to live: Every day to live out
All the truth that he dreamt,
While his friends met his conduct with
doubt,
And the world with contempt.

Was it thus that he plodded ahead,
Never turning aside?
Then we'll talk of the life that he led—
Never mind how he died.
—Author Unidentified.

THE RENUNCIATION OF CLAIRE

By Margaret A. Condon

(Concluded.)

"Oh, Peter! Just think of it. That wonderful bungalow with all furnishings complete, and on the lot adjoining our property, for only five thousand dollars. There's no telling what kind of neighbors we'll have there now," Claire interjected mournfully, "and I never wanted anything in my life as I want that house. Peter, could we—do you think we could possibly manage it?"

Peter shook his head dolefully.

"I'd love to do it for you, Dearie," he said, "but I don't see how we can just now. It would never do to use every cent of our cash in bank, Claire. What would we do in case of illness? I'm afraid, honey, we'll have to practice patience a little while longer and be content with our shack until we can afford to build a house ourselves."

Tears welled up in Claire's eyes.

"I feel that you're right, Peter," she said, "but it is hard for the want of a little money to see that wonderful house go to others. It just seems built for us. It's just what I want—furniture, rugs, everything."

"It's awfully hard to refuse you, Claire, but keep up your courage. Some day we'll build one just like it."

He drew the grieving Claire close and touched her bright hair with his lips, then stooped to rub "Johnny-jump-up's" silky back the wrong way for an instant, and thus dismissing the subject, Peter went back to his work.

But not so Claire. With her it was an obsession. She looked about her shabby little house that barely sufficed to shelter them. She forgot the great out of doors, the flowers, the grove, everything that had given her pleasure, and her mind could only grasp the fact that sooner or later someone would become owner of the house she wanted. It would stand provokingly under her eyes all day, but she must resign herself to renounce it. While Claire did not again refer to the subject, her former pleasure in her environment seemed to have disappeared. Peter noted that she was pale and listless and was concerned to see that her enjoyment of their country life and surroundings, which had been such an optimistic and encouraging note for him, was no longer apparent.

"Peter," Claire began one day at luncheon, "I had a letter from Florence today. George is doing well in his business and they have moved into a new house. She wants me to make them a visit—says they have a room ready for me—but I don't want to go and leave you alone, Peter. If we didn't have the ranch you would be free to come too, and have a good visit in town," and she looked around disparagingly.

"If we didn't have the ranch!" Peter echoed in amazement. "Why, what do you mean, Claire? Are you sorry we have the ranch? You know what it means to me, and I hoped it meant as much to you."

"I think things are getting on my nerves, Peter," Claire said wearily. "I want a room large enough to move around in. I want some of the things we were used to in the city. I'm tired of trees and fruit and crops and irrigating ditches and—everything." Claire finished lamely. "I'm tired of everything here but you and 'Johnny-jump-up.'"

Peter looked at her gravely, and his big warm heart sank, but he was gifted with wise judgment and his love for Claire made him see clearly.

"I think you're a bit lonely and not

feeling up to the mark, Claire," he said at length. You need change of scene. Write your sister today that you are coming to make her a visit. Johnny and I will manage to get along for a few weeks. You'll come back with a different viewpoint and appreciate us and the ranch all the more," he added, smiling rather wistfully at the girl.

"I appreciate you now, Peter dear; I couldn't appreciate you more. I'm just out of sorts, discouraged, that's all. I believe I will write to Florence today and tell her I'm coming for a taste of city life."

The afternoon wore on, and Claire—somewhat enthused at the prospect of seeing again her old friends and associates, was about to begin her letter when she heard voices outside, and going to the window saw Peter in earnest conversation with a gray haired man whose motor car was waiting for him at the gate.

"I have taken a liking to the place," she heard him say, and I am willing to pay your price if you will name it. No, I don't want the next house and lot. I want the grove, so that I can build my own house. Your property being on a corner gives me the opportunity to have an entrance on the side, since a street will soon be opened up there. Will you name the figure at which you will sell the grove?"

Peter's back was toward Claire, and she could not hear his reply, but the two men walked over in the direction of the grove, while she stood incapable of motion, a cold feeling about her heart, her knees trembling. "Sell the grove?" She could not understand the evidence of her senses. What did it mean? Sell their beautiful grove, the background of their little ranch. What could Peter be thinking of? It was unbelievable. Then it flashed into Claire's mind that he was doing it for her. Had she not told him she wanted the new house more than anything in the world? It was all her fault. He was going to use the money to buy the house. Things seemed whirling before Claire's eyes as she made her way to the door. She wanted to tell Peter he must not, should not, make the sale. As she opened the door the stranger was driving away, and Claire threw herself upon Peter as he came up the walk.

"Oh, Peter, Peter!" she cried. "What does it mean? I heard him ask you to make a price on the grove. Oh, what have you done? Are you going to sell our beautiful grove?"

"Not unless you wish it, Claire," Peter returned, and there was a suspicion of a twinkle in his kind eyes. Placing an arm about the excited Claire and guiding her into the house, he continued:

"You told me not long ago, Claire, that you wanted the new house more than anything in the world, and I wanted to buy it for you. This man is willing to pay a good price, and if we sell the grove we can at once take over the other place and still have that portion of the ranch which is under cultivation."

"But, Peter, I don't want the other place at the cost of our lovely grove. I wouldn't lose that for anything. Why, Peter—" and Claire was on the verge of tears now—"God made the grove and man made the house. We can build another house, but we could never, never find another grove like this."

Peter actually grinned. Most exasperating of him, Claire thought, but he maintained silence, and she went on.

"I know you think I'm inconsistent, Peter, but I can't help it. And I'm not going to the city, either. I'm going to stay right here and look after you. Why, you might sell the entire ranch if I were not here. There's no telling what you might do. I'm surprised at you, Peter."

"I was only trying to carry out your wish, Claire, to buy the house. You surely wanted it. Do you think now that you really prefer the grove?"

"Of course I do, you silly boy. You know I would like to have the house," and she cast a look of renunciation in its direction, "but never, never at the sacrifice of the grove. Our little house will do nicely until we can build a better one. I have you, Peter, and

'Johnny-jump-up,' and the grove. What have you told the man who wanted to buy it?" she asked suddenly.

"I'm to give him an answer when he comes tomorrow morning. He'll be greatly disappointed. I'll tell him you cannot consent to part with your grove."

And so it was settled. Claire, having made her renunciation of the bungalow in favor of the grove, was once more her old self, with reawakened interest in her surroundings. Her heart almost stopped beating when she recalled the awful possibility of what might have happened, and her little home was more precious than ever.

That night Peter and Claire sat on the little porch and watched the crimson glow fade from the sky. Then one by one the stars came out, and a half moon rose in the east and looked down upon them. Back in the grove the mockingbirds trilled their evensong and from the distance came the plaintive dual cry of an owl.

"How wonderful it all is, Peter," Claire said softly, and contentment was in their hearts.

Suddenly, Peter spoke.

"We'll probably be able to build next year, Claire," he said, and we'll model our house after the one next door. Perhaps," he added laughingly, "that long drawn out litigation over my Uncle Jack's estate will be finished some day and one-fifth of it will come to me. Then we'll—"

"Oh, Peter," Claire cried excitedly, "a letter came for you this afternoon and I forgot all about it. It's from a law firm in Boston, and I'll bet it's about your legacy. Come quickly and we'll see."

Claire dashed into the house, followed by Peter, who opened the letter, read it quickly, and said, while the color mounted into his face and his eyes shone with enthusiasm:

"You win, Claire. The letter is from the attorneys. The estate is settled and my legacy of ten thousand dollars is at my disposition."

For a moment there was dead silence. Claire was too overcome to speak. Then Peter continued:

"The bungalow is yours, Claire. I'll buy it in your name. We'll go in tomorrow to see the agent and close the transaction. Hurrah! Claire you get your wish and keep the grove," and he bent and kissed her.

Claire's eyes were shining, her cheeks glowing, as she nestled close to Peter, and he asked:

"Happy, Claire?"

"Happy!" the girl replied. "I'm so happy I'm afraid I'll wake up and find it all a dream."

One soft arm went round his neck, and she whispered:

"How glad I am I didn't go to the city! And isn't everything wonderful, Peter. 'God's in His Heaven: All's right with the world.'"

CHICKEN TAMALES

Scald one quart white corn meal, not soft, but moist. Have ready corn husks and several torn into narrow strips like ribbons. Have thoroughly cooked and chopped fine a good-sized chicken; add to it a Spanish pepper chopped fine, a small onion and sufficient salt to season. Dampen corn husks, straighten them out, put down the center a strip of the corn meal about three inches wide and six inches long. Put in two tablespoons chopped chicken, then roll husks and corn meal over, making a roll with chicken inside. Fold ends of husks in and tie carefully with prepared strips. Put chicken bones in bottom of kettle to form a rack, keeping tamales from being covered with water. Add three or four cloves, a bay leaf or two, a teaspoon salt and one-quarter teaspoon pepper. Cover with cold water and boil continuously two hours.

Tamales Spanish

Three dozen ears green corn, with husks, one boiled chicken, 12 chile peppers (seeds removed) 1 quart stoned olives, two pounds seedless raisins, two cups lard, salt to season. Scrape corn from cob, mix with chicken and other ingredients, all chopped moderately fine. Divide in two dozen small portions and tie up in husks. Steam for one hour.

Beef Tamales

Boil one pound of beef and pour over it some hot beef fat. Scald thoroughly one quart corn meal, adding

one teaspoon salt and a tablespoon lard. Cup off the upper end of corn shucks and put to boil in cold water; let scalded meal and shucks cool off; chop the beef fine and season to taste with salt and chili powder. Put a thin layer of meal on shucks (leaving shuck enough to turn ends and sides under); then put a small quantity of meat in center. Put a few shucks in bottom of pot to prevent scorching

and pack in the tamales, placing a weight on top. Cover with boiling water, adding one tablespoon each of lard and chili powder. Steam two hours.

How many housewives keep accurate account of their business at home?

Nothing like thrift to make the whole family happy.

HOUSEHOLD QUERIES

Home Made Olive Oil

In the Cultivator of November 27 reference was made to directions for making olive oil at home, published in the issue of January 4, 1919. This article was written by W. V. Cruess of the state university. This seems to have aroused much interest, judging from the number of requests received for reprinting. We therefore give the article entire on another page of this issue.

"Mrs. Wilson's Cook Book"

Would you be so kind as to send me information as to how to get or send for "Mrs. Wilson's Cook Book." I would like to own one but have lost address.—Subscriber, Lompoc.

This book is published by J. B. Lippincott Company, Philadelphia. The price is \$2.50 net and postage 24 cents additional. Local book dealers may carry it in stock and their general rule is to prepay postage to within 200 miles.

Sugar Cure for Meat

I see in the last Cultivator of November 27 a recipe for curing meat. I find that four gallons of water will not cover the meat. What am I to do; use clear water or add more brine?—Subscriber, Cloverdale.

It will be necessary to make up more of the brine, mixing all the ingredients in same proportions. For instance, if you think about one-eighth of the quantity given would be sufficient to cover your meat, mix up another lot of brine, dividing all quantities by 8—1 pound salt, ¼ pound brown sugar, ¼ ounce saltpeter, dissolved in 2 quarts water. If you only need half this quantity, divide each again by two; if twice the quantity, multiply. Meat should be kept thoroughly well covered by the brine, so it might be well to note the pieces on top which were not covered, and if they show any signs of spoiling throw them away rather than risk tainting the whole amount.

Candy Dipped Apples

In your paper some time ago I saw how small apples were candied for a party. Now I have a children's party to plan for the holidays and would like to know how to candy apples. Some of your subscribers can probably tell me how I may candy these apples and at the same time keep them raw. All hot candy cooks or partially cooks them, which I do not want. I have lost the paper giving the recipe for same but think you may have it on file, also a recipe of a candy which can be used cold, if that is possible. I do hope to learn of some way to fix these apples to make my party a success.—Subscriber, Salinas.

We do not see how any candy could be used cold for this dipping process, as the quick hardening on cooling gives the brittleness and glaze which makes the dipped apples attractive. However, we would be glad to hear from any who have experience. The usual method is to remove stem and blossom from apples, push wooden skewer firmly down in stem end, boil together sugar with half the amount of water to the "hard crack" stage. Remove from fire, leaving on back of stove to keep warm. Dip the apples in and out instantly. It is not necessary to let the apples remain in the candy. They should be removed immediately and placed in draft to cool quickly. Stand on blossom end on oiled or buttered paper. A spiced red coating may be made by melting in the candy some of the "Cinnamon Hots" beloved of childhood days to color lips and cheeks.

Spanish Herbs

Sometime ago I noticed recipe for cooking beans, using Spanish herbs. Can you tell me what these are and where I can get them?—Subscriber, San Martin.

The use of Spanish herbs was recommended in a recipe for cooking pink beans given by Mrs. Torbert in the Cultivator of April 10, this year. The herbs are oregano, a dried leaf of a plant of the lippia family, and comino (cumin) seed. More of the leafy herb should be used because of

the stronger taste of the comino seed. Most large groceries carry these two seasoning herbs separately and five cents worth of each will last a family for a long time. We have on file names of groceries in Los Angeles and Stockton who carry them, but doubtless large groceries in other centers do as well.

Candying Apples

I recently saw small apples candied whole like the limes and apricots one pays such prices for as confections. Can you tell me how to do it?—Subscriber, Los Angeles.

Puncture small apples, through and through in several places with a silver fork. Cook carefully in water until tender. Avoid breaking skin. Place the cooked fruit in a pan or stoneware crock or other convenient vessel. Prepare syrup of Karo or glucose 1 cup and water 2 cups. Heat this to boiling and pour it on the prepared fruit. Leave 24 hours. After 24 hours pour off the syrup and to each 4 cups add ½ cup of sugar to each 4 cups of syrup, pour back on the fruit. At intervals of 24 hours repeat this process adding ½ cup of sugar to each 4 cups of syrup each time until the syrup becomes very thick and of about the consistency of thick honey. Leave the fruit in this syrup about 1 week. Remove the fruit and drain it. Place it on a coarse wire screen and allow to dry for about 1 week in a room where a draft or breeze will strike it. Pack in pasteboard boxes or open jars. Do not use sealed containers.

PREPARE FOR SICKNESS

The time to prepare for sickness is while you are well, and this does not mean to borrow trouble, but a reasonable amount of forethought about events that are sure to come to pass at some time is sure to prevent trouble.

Every child should be taught what the pulse is, and why and how we feel it at the wrist. It is very easy to understand how to tell the pulse, and not at all difficult to learn to use the clinical thermometer. While everyone cannot have the opportunity to study thoroughly anything that belongs to trained nursing, most people can, if they try, pick up little points from doctors and by being among sick persons, and will in a short time get a rather good idea of what needs to be done in emergencies, and this knowledge will be of very great assistance to the physician.

Everyone whose circumstances are such that they can live as civilized people should have plenty of good bed linen, and then as the pieces become worn they should be saved, as old sheets and pillow cases, if whole, are preferable to new ones in the sick room. Save all the pieces of old soft cotton, flannel and linen, wash clean, rinse in clear water, then sterilize them by rinsing in warm borax water and press smooth. These are to be used for bandages, poultices and mustard plasters. Have a roll of adhesive plaster, a generous square of arnica court plaster, a box each of powdered borax and ground mustard, one cake of pure castile soap and one hot water bag, and provide a nice woolen cover for the latter. A mustard plaster made at the right time and placed in the right position might save a life. In the sick room a tablespoon each of salt and borax in a pint of water makes an excellent gargle for the throat and for infections of the throat, thrush, etc., there is nothing better than this powder and honey in equal parts and well mixed. Use a little of this powder in the water for bathing a sick person instead of soap, as this keeps the pores of the skin open so it can expel the waste matter, while soap irritates the skin.

If you have any property, no matter how much or little, be sure to make your will while you are strong in body and mind, so the money or things you have will go to the people you desire to have them, and if this is done it may save you much anxiety in your last illness.—A. M. H.

CUTTING UP

Freight Auditor—Were you in on it when our directors cut the melon?

Cashier—No. But I cut some figure when they cut the payroll.

MEN WANTED TO LEARN AUTOS & TRACTORS IN LOS ANGELES

Men of any age with no previous experience can learn auto and tractor business in few weeks. Earn Big Money as repairman, tractor expert, or go into business for yourself. We help our graduates get started. Only school in America giving advanced auto-electrical training and actual garage and repair shop practice. All year 'round tractor field work. Training includes tire repairing, machine shop, driving and repairing all makes of autos, tractors and gas engines. Earn board and room while learning. Success assured. Jobs waiting. Write NOW for FREE book of facts telling about your chances in this business. Tells about men from your home town who are successful National graduates.

Southern Protection Congress

CALIFORNIA producers of beans, nuts and fruits, who are seeking a measure of protection from the product of cheap European and Asiatic labor, are planning a presentation of facts which will show that their industries must be protected if they are to live. Naturally, practically all are anticipating a fight from free traders of the East and, more particularly, of the South, but these free traders do not seem to be so abundant as formerly, as may be noted by the fact that a tariff congress has been organized at New Orleans and steps are being taken to secure protection for southern productions and manufactures. We note the following in the Rice Journal under the caption "Southern Production Congress to Work for Adequate Tariff on Rice":

"That an organized effort is to be made to secure tariff protection for rice and other Southern products that are forced to come in competition with those of foreign countries produced on a cheaper basis, will be welcome news to rice growers who are compelled to stand by and watch their industry perish under a policy of government that encourages foreign, at the expense of domestic production.

"The Southern Tariff Congress, organized at New Orleans last month with John H. Kirby of Houston as president, is undertaking to assemble the best thought of the South from a commercial, industrial and political standpoint to secure tariff revision favorable to productive industry.

"The organization is strictly non-partisan as far as politics is concerned and its activities will be carried on without reference to whether a democratic or republican administration obtains at Washington and regardless of the political complexion of congress.

"That the tariff is an economical and not a political question is the opinion of the organizers of the congress and democrats and republicans will share equally in its deliberations.

"As evidence of its non-partisan nature the participation of Hon. Jno. M. Parker, governor of Louisiana, and Senator A. H. Hall of New Mexico in the initial meeting of the congress is pointed out. Governor Parker, although a lifelong protectionist, is a staunch democrat and was one of the ablest speakers for Governor Cox during the campaign. Senator Fall, on the other hand, is a rock-ribbed republican and high up in the councils of that party. And along with a message of felicitation from Senator Harding came offers of assistance from the democratic governors and United States senators of practically every Southern state.

"In view of the fact that any discussion of the tariff heretofore has been looked upon as political propaganda, the action of democrats and republicans in uniting in an effort to secure proper tariff measures is regarded by industrial leaders who have advocated taking the tariff out of politics as a long step in that direction.

"The purposes of the congress are clearly outlined in the official call issued by Hon. Jno. H. Kirby, Governor Parker, Geo. W. Armstrong and the New Orleans Association of Commerce:

"To provide a non-partisan forum for the discussion of public policies as they affect the progress and prosperity of Southern industry.

"To recommend to the federal tariff commission and to congress a tariff schedule on Southern products that will equalize the cost of production in this country with that of foreign countries, consistent with the public welfare.

"To discuss enlarging the powers of the federal tariff commission by giving it authority to adjust schedules to meet the changed conditions brought about by natural or artificial causes where such a course is clearly necessary to foster American industry and to conserve the public welfare.

"To discuss the problems of foreign trade development and the bearing thereon of the fact that the United States is now a creditor instead of a debtor nation; and the need for American markets for those foreign prod-

ucts relied upon by foreign consumers of American products to pay their bills.

"To form a standing committee commissioned to speak for the productive industries of the South on national and international commercial policies of government.

"To permanently organize the Southern Tariff Association.

"An executive committee which will be composed of the strongest men from each industry, including rice, will be named at an early date and the time and place for holding the next session of the congress will be decided on."

FALLING CROP PRODUCTION

Crop production in this country in 1919, as estimated by the bureau of crop estimates of the United States department of agriculture, was 11 per cent above the average of the prewar years 1910-1914, and this was not previously equaled except in 1915 when the production was 16 per cent above the average. Late in the growing season of 1920 the production of crops was apparently 13 per cent above the average.

A tale of another sort is told when crop production is compared with population. During the last 30 years the largest per capita production was in 1898, when it was 12 per cent above the average of 1910-1914. In most of the years from 1896 to 1915 per capita production was above the average. The highest point, however, reached since 1915 has been the average of the five years mentioned, and this was done in 1917 and apparently in 1920. Notwithstanding the great mass of the crops of 1920 they are, after all, no greater than the average when compared with the great mass of an increasing population.

HIGH PRODUCING CORN

A Sonoma County subscriber, A. P. Martin, has tested out corn which has been exceptionally satisfactory. He writes:

"Induced to invest in some seed corn from a descriptive article and advertisement in the Cultivator last spring, it gives me pleasure to announce that every claim put forth therein has been fully justified by my experience.

"I planted about six acres on my hill farm seven miles west of Petaluma and have a wonderful crop. Without irrigation or fertilization the crop stands from ten to 12 and more feet high, with from two to 13 ears on a stalk, stalks from two to more inches in diameter. What makes it peculiarly valuable for ensilage is the fact that while the grain fully ripens the stalks, leaves and husks remain green for some time thereafter."

NEW OATS IN STOCKTON DELTA

After testing more than 100 different varieties at the university farm, the Burt oats has been selected as most promising for such conditions and the Sperry Flour Company at Stockton will distribute the seed for a number of experimental plantings. The Burt oats has a gray seed, an unusually stiff straw, makes a rapid, vigorous winter growth and ripens early. It matures earlier than the other varieties and is better adapted to spring planting. In 1920 it yielded at the rate of 74 bushels per acre at the university farm, as compared with 60.7 bushels for the red oats and 46 bushels for the black oats.

The Tehama County farm bureau will hold center meetings during December at Corning, 16; Bend, 17; Richfield, 20; Proberta, 22; Liberal, 23; Manton, 24; Bowman, 25; Los Molinos, 27. The directors meeting will be held in the farm adviser's office, Red Bluff, on December 18.

The Raisin Growers Association is considering uniting with orange, walnut and other shippers in making shipment by way of the Panama Canal in the effort to secure a reasonable freight rate.

For Every Bookkeeping Need

Bookkeeping with Burroughs Machines is displacing bookkeeping with pen and brain in all kinds of business, everywhere.

A Burroughs makes the greater part of the work automatic. It enters the items, classifies them, totals debits, totals credits, subtracts, and prints the balance—all with unfailing accuracy and great rapidity.

When the Burroughs man calls give him just a little of your time. He knows accounting methods. He can point out short cuts to you and help you solve your bookkeeping and other figure problems.

Adding—Bookkeeping—Calculating Machines Burroughs

GRAIN AND COTTON SEED

BUNYIP, BAYAH and DART IMPERIAL SEED WHEATS

California acclimated Australians; best milling; higher prices for product; yield well; shatter less in wind than other varieties known to us.

MARIOUT

There is large demand for this early maturing, drought resistant barley. Car load just shipped Miller & Lux averaged approximately 180 lbs. per sack. All our cleaned Mariout, when well-dressed, has approximately such weight.

All our seeds grown on new soils, one irrigation only. All water from deep wells. No Bermuda, Johnson or Morning Glory.

Last call for Beldi Barley, Sonora, Early Baart, and the so-called Diener Hybrid Wheats, but can yet supply less than car load lots. No Tennessee Winter or Four Thousand Barley.

DURANGO and MEBANE COTTON SEED

Fully matured seed from purest strains known to us, grown in selected hand-rogued fields. We operate our own gin, carefully avoiding seed mixing.

All seed orders, whether car load lots or less, booked as received, shipments following consecutively.

Write for prices, stating quantity desired.

Shire Horses FOR SIZE BONE and QUALITY

More is required of horses than ever before hence the need of more size, weight and power. Large geldings never were higher. Shire geldings usually top the market. Use Shires to raise larger and better horses.

For information on Shires write,
W. G. Lynch, Secretary American Shire Horse Association, Tropic, Illinois

Guilds of Greed

By A. L. Spellmeyer

IN the Middle Ages there were guilds of workmen and producers with strict laws governing the control, sale, volume and profit on articles made and sold. These guilds built many of the historic places in Central Europe and paid the tribute which supported the government of their kings and princes. The guilds became so powerful that governments were subject to them, but on the whole, their actions being prudent and careful, industry thrived and poor men were unknown at this period. Later, their power broken through the wedge of religious difference, the rulers smote them and disrupted their power, people starved and reformations and social upheavals followed.

If one could have looked back a few years and seen the effect that the retail associations would have upon the cost of products to the consumer and the price to the producer, such associations would have been nipped in the bud. Today the associations of butchers, bakers, grocers, packers rule the trades they handle. The only flaw is that they are all parasitical organizations instead of producers. They depend upon the farmer and livestock man they gouge. When production becomes unprofitable they will have nothing to sell, trade with or gouge from. They can explain their 100 per cent gross profits glibly, but that doesn't justify them nor does it justify the existence of such a complicated handling of simple products until the consumer pays many times the cost. Right in this state today the cost of barley from the farmer to the consumer equals as much as the farmer gets for his entire product, including expense and land income. The 50 cent porterhouse, the 50 cent pork chop continue with ten cent hogs and nine cent beef. What has happened? Cooperation and organization carried out to the last limit in all industries except those of actual production, farming, livestock raising and mining.

As to the permanent best interest of a country or a people, cooperation carried to such an extreme degree may cause disaster. It certainly compli-

cates marketing of products and adds expense. If the farms organize and the cattlemen organize they will bust open all the middlemen organizations until the people themselves organize. No wonder in a political year our sworn servants of the law were afraid to punish too many profiteers and took great care where they stepped.

The orange men have a competent association, but this year they are making no profits. Fertilizer, owing to the absence of livestock, is costly, and the labor has been costly which made this last crop. Then the railroad freights are high and shave that much margin from producers' prices, as the orange market means distance transportation.

It's the same with the olive men who cannot sell their products owing to a false alarm and cheap importation. The walnut men are suffering from an unsold crop, foreign competition and lower prices.

Is it possible in the face of the temporary impotence of even strong producers associations to doubt that there is a danger to all farming in this nation?

The guilds of greed, in retailing and market manipulation have sapped production. Money is put in a sock when men don't know where they can get a further supply of it, and when banks hedge and withdraw.

If this keeps up everything not yet down will come, including bank stocks and bonds, and there will be devastating failures in a wealthy country which has and is today financing and feeding a great part of the world. If the nation is to prosper the first step is to protect the farmer.

Without money and without profit there will be many acres less planted in California this fall, as men haven't the cash for seed and labor. There will be less cattle, hogs and sheep. Why should the producer, the farmer, the cattleman, the hog raiser, the sheep man, stand all the loss of readjustment? It should be distributed with middlemen bearing the bulk of loss on depreciated goods they have in stock. They made a profit on goods in stock before values advanced.

In and Around the Dairy

WHEN you sit down to milk a cow that has a long haired tail with which she likes to "switch" you in the face, bring a few hairs around her leg next to you, make the first part of a loop knot, then twist the ends together a little and clasp a spring clothespin over the place where the hairs cross. After a little experimenting the fastening can be made surely and quickly. When milking is finished remove the clothespin and let the cow "switch" all she wants to.

On many farms where milking is done by hand a mistake is made in not milking the cows dry or clean. Many cows go dry much sooner than they would if the milk was all drawn at each milking. If the young folks on the farm help do the milking, explain to them that unless all the milk is taken, nature will not furnish it and that the first milk drawn contains only a little butterfat, while the last, or strippings, is nearly cream.

Temperature is a factor that requires thorough knowledge in order to obtain best results with milk, cream and butter. The following will serve as a guide to the uninformed in the application of temperature: Milk for separating, 88 to 98 degrees Fahrenheit. For ripening cream when churning three times a week, temperature of 58 to 60 degrees; when churning once a week, temperature of room, 54 to 56 degrees. Temperature for churning in summer, 52 to 54 degrees; for churning in winter, 58 to 60 degrees. Of course, a reliable dairy thermometer must always be used.

Much of the butter made on the farm is not salted properly. The chief cause of uneven salting, that is sometimes high and sometimes low, is not weighing the salt and butter but guessing at the weights. While it may be pardonable to estimate the weight of

butter in a churning, which some are able to do with surprising accuracy, it is never advisable to "guess" at the weight of salt required for a certain amount of butter. On each and every farm where butter is made there should be a scale that will weigh to ounces or finer. Suppose there are 12 pounds of butter in the churn or on the worker, weighed or estimated, then salt should be added at the rate of one-half to one ounce per pound of butter, according to taste or market requirement. If mild salting is desired, six ounces of salt will be enough to add to 12 pounds of butter. If, however, a quite pronounced salt flavor is liked, then add 12 ounces or three-fourths of a pound of salt. If a uniform rate of salting were followed there would not be the variations in salt flavor so common in farm made butter.

It is very important that the salt be evenly distributed throughout the butter. Salt tends to deepen the natural color of butter, therefore where the salt is unevenly distributed throughout the mass of butter some parts are more yellow than others, causing a streakiness which is quite objectionable. Persons who do the salting in the churn in order to avoid bringing the butter in contact with warm air on a worker in the room are more likely to have mottled or streaked butter than those who salt on a worker although salting in the churn has several advantages.

One of the most objectionable faults in butter is "grittiness." This is caused by the use of coarse salt or too much salt—more than can be dissolved by the moisture present. In these days of fine dairy salt manufacture no buttermaker should add coarse salt to butter. Rolling such salt with the rolling pin will not make it fine enough for buttermaking. Salt should

be in the finished butter as a "brine" or be dissolved in water. Butter must carry a reasonable amount of moisture at the time of adding the salt in order to dissolve it, else "gritty" butter will result. It is for this reason that butter must not be too dry at the time of salting. When the water evaporates from the butter the salt is left behind as a crust on the butter or in fine particles. Some are troubled with this condition. The remedy is to keep the butter moist by sprinkling water on it.

On many farms there is considerable old barbed wire lying around, much of which could be rolled up and made useful. From the standpoint of economy it should be taken care of. This is not the chief point that I had in mind, however. What I wanted to emphasize in this connection is that a cow is likely to cut her udder and teats on barbed wire lying around. This is true whether it is lying around in the yard or whether it is fastened onto posts and hanging loose. A cow is very likely to try to crawl through a fence made up of two or three loose barbed wires. This is especially true if there is corn or other tempting food on the other side of the fence next to the pasture. Such a wire fence should be stretched and stays be put on between the regular fence posts. This may save much trouble with sore teats and udders; besides, it may prevent considerable loss of both feed and cows. A number of cows may go through the loose wire fence into the alfalfa field, eat too much of it and bloat and die over night. They may get too much corn and spoil lots of it.

In case a cow does cut a gash in the teat or udder, do not forget to wash it out thoroughly with disinfectant. Soak it about 15 minutes in about a two per cent solution of coal tar dip. Then apply some good salve. Vaseline is suitable. If no salve is at hand, use a good grade of lubricating oil and even ordinary axle grease is good. Most any of these will keep the germs from getting in and it will keep the air from reaching the raw sore. When a cow with such a sore udder is milked use care not to reopen the wound. Put the sore side of the teat against the side of the hand. I have seen milkers who have deliberately put the ends of their fingers directly on the sore. If the cow kicked she was punished severely. One cannot expect a cow with a partially healed barbed wire cut on her teat to stand absolutely quiet when it is being bruised in that manner. It is always safe to tighten up the loose wire fences and to pick up the small pieces of barbed wire lying around the barnyard and on the farm. Also, remember that barbed wire is worth money nowadays. —W. H. D., in Indiana Farmers Guide.

AVOID LOSSES OF HOGS IN SHIPPING

At a recent conference on livestock losses, called by the National Livestock Exchange, W. J. Carmichael, secretary of the National Swine Growers Association, presented a paper on "Hog Shipping Losses and the Prevention Thereof." In concluding his paper he stated that most of the losses could be avoided by:

Careful, humane handling by all agencies under whose jurisdiction the hogs come.

Careful inspection and supervision to see that all equipment is of the proper and safe type and in good condition; particularly cars, chutes, yards and conveyances.

Avoid overloading the cars.

Proper bedding in summer and winter and adequate, thoroughly supervised drenching or the use of ice in summer.

Adequate partitions in the case of mixed loads.

Particular care in the case of hogs which are "slow or slightly off."

Avoiding excessive fills before handling the hogs.

Production of hogs of a type which has a natural ability to travel well.

Handling with as great dispatch as conditions will warrant.

Supplying an adequate supply of chutes for unloading when the hogs get to market and wide driveways and gates.

A thorough campaign of publicity to the end that the foregoing shall be enforced.

HARMLESS CYSTS IN HOG TISSUE

As the cool weather approaches the rancher's attention will turn to some of his fattened hogs destined in a short time to add to the family needs what is commonly termed "good old country pork." Before the killing operations begin, it is well to consider a harmless abnormality frequently found in hogs, particularly those fed on dairy products.

Very often when the contents of the abdominal cavity are removed numerous clear cysts of various sizes are found along the outside of the small intestines which may suggest to one unfamiliar with such a condition that the meat of the carcass is unfit for food. Numerous experiments have been conducted in order to determine the cause of this condition, but as yet no specific cause has been determined. Some investigators attempted to prove the condition due to pathological organisms while others cling to the theory that the cysts are due to processes of mycotic origin and consider the action of yeast cells the cause. Observations by others have disclosed that the majority of hogs so affected were those fed on waste products of the dairy.

The condition is known as mesenteric emphysema for the reason that the cysts which form under and between the folds of mesentery are filled with gaseous material commonly termed "air." Two kinds of tapeworm cysts, which when eaten by the dog produce tapeworm, are found at times on the peritoneum of the hog. Those who are not capable of differentiating between the cysts of mesenteric emphysema and those of the tapeworm embryos should not permit dogs to eat any of the bladder like formations. Mesenteric emphysema is not known to produce any deleterious properties in pork. If no other abnormalities are found in the carcass the meat may be regarded as fit for food. The intestines, however, should be buried deeply or burned.

ABNORMAL TASTES AND ODORS OF MILK

Such aromatic feeds as ensilage, cabbage, rape, beets, turnips, rutabaga, carrots and their tops impart a characteristic odor and taste to milk. The taste and odor produced by these substances in milk is not due ordinarily to their ingestion by cows or to their elimination through the udder, but to the highly absorptive powers of the milk after it is drawn.

Experiments have shown that when these products are fed in moderate quantities and always after milking—not immediately before or during milking—the milk is not tainted by any special odor or taste. However, if fed in excessive quantities it is quite probable that contamination of the milk by these aromatic substances takes place through the udder. The volatile oil or garlic, to which the odor of that plant is due, is eliminated with the milk through the udder.

When milk is warm, that is freshly drawn from the cow, odors are readily absorbed. The stable odor and taste is acquired by milk which has been allowed to stand in unclean or poorly ventilated barns or milk sheds. Again, experiments have shown repeatedly that milk ranging in temperature from 57 degrees to 72 degrees Fahrenheit, when exposed to the odor of ensilage or horse manure from 30 to 60 minutes, acquires the odor and taste of such substances.

KEEP THE SHIPS ON THE SEAS

Many of the far seeing people of the country feel that not sufficient attention is being given to our merchant marine. Time was when America ruled the sea; prior to the war the Stars and Stripes had almost disappeared from the harbors of the world. The war made possible or, rather, made necessary, the coming back of American shipbuilders. Now the ships have been built and it is reported that in some harbors literally hundreds of them are anchored pending their disposal. The moving of our farm crops and of manufactures of all kinds calls for these ships being put into commission. From the tone of other papers the land over we think the demand is most general that these ships should be put into commission.

HERD REDUCTION SALE

Guernsey Females

We are over stocked with Guernseys and we offer a pick of anything on the place. Imported cows and A. R. cows, with high records and their show-winning offspring from such bulls as Effie's King and King of Hollow Hill. Also some wonderful producing 15/16 Guernsey grade cows and their heifers.

Bulls ready for service and bull calves. Walk into the herd and take your pick. Guaranteed free from t. b. and safe breeders. This is the greatest opportunity to buy Guernseys of highest type and production ever offered in the West.

THROCKMORTON'S DISPERSAL SALE

Having sold my ranch, I am selling my entire herd of

REGISTERED BERKSHIRES

AT PUBLIC AUCTION

At the Ranch Two Miles North of

Sebastopol, California

December Eighteenth

THE OFFERING:

Includes my complete show herd carrying the blood of the champion Baron Duke and Rookwood Lady 100th—the blood that has made Berkshire history. The sale will include 30 choice sows and gilts, two herd boars and several extra good prospects for next year's shows. This is one of the choicest offerings of Berkshires to be made this winter.

I will also sell my entire farm equipment and household goods.

The sale will be held on the highway two miles north of Sebastopol and eight miles west of Santa Rosa.

Good Hogs Made Better

All hogs that grow fast and produce pork at a profit are good hogs. And the difference between good hogs and poor hogs—*between profit and loss*—is largely the difference in their health and vigor. You can hurry your hogs to market weight in shorter time—cash-in on them quicker—make good hogs better—make poor hogs profitable, by adding to their ration a small amount of

Pratts Hog Tonic

Not a food—does not actually grow bone and flesh—but a tonic and regulator, that tones up the system and puts hogs in tip-top condition. Helps keep disease away, makes hogs healthy and hearty. Then they stand up under the strain of heavy feeding and turn *all* their feed into pork. If you've never used Pratts Hog Tonic you don't realize how fast a hog can grow if given a fair chance.

Here's what we know about Pratts Hog Tonic—and our money-back guarantee backs this statement: It makes hogs healthy—it keeps hogs healthy—its use brings more pounds of pork from each bushel of feed—it brings hogs to full market weight 30 days quicker—it improves breeding stock so big litters of strong pigs are the rule.

"Your Money Back if YOU Are Not Satisfied"

Make the test at our risk. Every day you delay means a loss to you—so start today.

Duroc-Jersey Swine of Highest Quality

The Cattle Situation Today

By A. L. Spellmeyer

There is some cattle movement in California. The North has plentiful rains and warm weather to start the feed. From Porterville north feed prospects are fine. Grass is fine around Stockton and both the San Joaquin and Sacramento will bloom by early spring with fence high alfalfa in places. A dry streak from Saugus to MacFarland, relieved by a few sprinkles, finally received a nice rain December 1. Feed has not done more than root and start in Kern County, but mild weather should bring it along in good time. The coast has brought in some cattle; various ranches are now fairly well filled. The upper and central part of California has brought in several thousand Nevada cattle. Northern beef buyers were last week working as far south as Bakersfield. They advise of plentiful beef north—which doesn't explain their presence so far south. The Kern County people are bringing in several trainloads of their Diamond A steers. Hart ship-

ped in some steers to Coalinga district. Twistelman brought in some calves and Klipstein some Globe Arizona and Winslow cows. Some cattle have been brought in to El Toro and south of Santa Ana district.

Money is scarce and ranch rentals have not dropped with cattle prices. I saw one man who two years ago sold \$250,000 worth of beef, shipping a few cars of steers to save that \$5 a day shipper's expense. I have seen men get down to old time economies of saving a nickel.

It is a sad day for general business when the life blood of profit is drained from the farmer and cattlemen, as they know how to cut down and are not too young to remember the time when a top ranch hand got \$20 a month, and when a shirt cost 50 cents. The present policy is forcing money into a sock, cutting production and will eventually hurt all business if it isn't relieved soon by a living profit to production.

The Wool Growers Getting Together

The National Sheep and Wool Bureau of America will lend its entire support to the plan of Senator Reed Smoot of Utah to secure a year's embargo on the importation of wool. This announcement was made by President Walker upon his arrival from New York to take part in several wool conferences that are to be held in connection with the International Livestock Exposition at the Union Stock Yards, Chicago.

The National Sheep and Wool Bureau of America last January secured the introduction of the French-Capper Truth in Fabric bill which is designed to compel textile manufacturers to stamp their cloth with its content of virgin wool and of shoddy—old rags reworked in some cases as often as eight times.

President Walker said that 110 organizations of all descriptions, some of them of nation wide influence, have now endorsed the Truth in Fabric measure and that five or six new resolutions are arriving at the headquarters of the bureau daily. Among the strongest supporters of the measure is the American Farm Bureau Federation, of which J. R. Howard is president. Mr. Howard is a governor of the bureau. Mr. Walker said:

"The National Sheep and Wool Bureau of America is greatly in favor of Senator Smoot's embargo proposal and will give it and also the proposal for a tariff high enough to adequately protect the wool growers of the United States the same whole hearted and vigorous support that it is giving the French-Capper Truth in Fabric bill.

"It must be clearly understood, however, that neither an embargo nor a high protective tariff would of itself be able to protect the sheep grower from his greatest foe, the junkman. Even with the embargo and the tariff in effect, the wool grower would still need the protection of the French-Capper Truth in Fabric bill to shield him from the unfair competition of the rag picker, because shoddy would still be sold as virgin wool under cover of the misunderstood popular term, 'all wool.' The wool grower will be at the mercy of the shoddy interests until there is passed a law making it compulsory for the textile manufacturers to label their cloth with its content of virgin wool and of shoddy.

"With the farmers still burdened with their wool clip of last spring, with the storehouses of the world choked with four billion pounds of unused virgin wool, with the popular demand for virgin wool cloth artificially diverted by certain textile manufacturers from the wool grower to the rag picker, it is absolutely essential for the protection of the wool growers that the French-Capper Truth in Fabric bill be enacted as soon as congress reconvenes."

Last March the interstate and foreign commerce committee of the house of representatives held a hearing on the bill, but adjournment was taken before the measure was reported out of committee. This December a hearing on the measure will be held before the senate committee on interstate and foreign commerce.

Tulare Holsteins Average \$245

The fourth Holstein consignment sale held at Tulare, Thursday, December 2, attracted a fair sized crowd of breeders. The offering was selected from 11 herds and was a very good offering. Owing to shortage of rainfall in the vicinity the local support was not as strong as might have been noted under other circumstances. The top of the sale was the good heifer, Just Jenny Wren, consigned by Peter Lowson, Tulare, and bought by D. Carmignani, Dos Palos, for \$600.

Burr Farm, Los Angeles, was the heaviest buyer, taking a total of 22 head, including a large number of the tops. D. Carmignani, Dos Palos; Carl L. Lewis, Riverside; R. Zangl, Bellflower, and Chas. Hubbard, Riverdale, were all heavy buyers. A total of 67 head sold for an average of \$245 per head, which was considered quite satisfactory. Throughout the sale there was evidence of the strength of the demand for the better sorts.

The sale was managed by C. L. Hughes of the California Breeders Sales and Pedigree. Col. Ben A. Rhoades of Los Angeles was the auctioneer. Col. George W. Bell of Tulare assisted in the ring.

SOME PROPERTIES OF MILK

Of the several physical properties that have been extensively studied in milk hygiene, color, odor and taste occupy an important field.

The color of milk is generally white and opaque with either a yellowish or bluish tinge. The calcium caseinate is responsible for the white color, whereas the opacity is due to the combined calcium caseinate and fat contents. The opacity of milk depends upon the quantity and size of the fat globules; the opacity being less when the fat globules are large.

The yellowish tinge often observed in milk is due to a pigment in the fat content, known as carotin. This pigment is more pronounced in certain breeds of cattle, for example in the Guernseys. A low percentage of fat content brings about the bluish tinge; however, the bluish tinge is sometimes associated with skimming and watering, but on the other hand, any normal milk in thin layers always has the characteristic bluish tinge.

There is a slight odor to normal milk, resembling somewhat the exhalations from the cow's skin, while it also has a sweetish taste. A salty, bitter, or a rancid animal-like taste may be observed in the milk of an individual cow during the colostral period or near the end of the lactation period. A similar taste may be noticed also in the milk from cows in an advanced state of pregnancy, as well as after abortion; in cases of mastitis (garget), also during digestive disturbances.

In case there are a number of "stripers" in a herd, a like condition may be present in the mixed milk. Milk which has a certain degree of acidity will act upon rusty containers, forming iron lactate, which gives to the milk a bitter astringent taste.

Rusty milk vessels, as well as those not rinsed free from soap powder, often produce in milk a "fishy" taste.

EYE TEST SERVES AS CHECK UPON CATTLE TUBERCULOSIS

The eye test for detecting tuberculosis in cattle has the approval of the scientists of the bureau of animal in-

dustry, United States department of agriculture. The ophthalmic or eye test is used as a check upon the older methods, as it happens occasionally that an animal that will not react to the subcutaneous injection or intradermal test will react to the eye test.

Two tuberculin tablets are placed in the conjunctival sac beneath the lower lid of the left eye, and observations are taken at approximately the third hour following and at frequent intervals up to 24 hours. Reaction to the test is indicated by discharge and swelling.

The bureau of animal industry is not prepared to accept the evidence of

the eye test alone where cattle are intended for interstate shipment. The test, however, furnishes an additional safeguard when used with the older method.

The eye test is not well adapted for use upon range cattle or cattle in transit, because of the possibility for dust setting up an irritation not related to tuberculosis. It has its best use on the dairy farm, where conditions are such as to give sure results.

The experts have observed that in herds which are frequently tested by the subcutaneous method it is advisable to apply the intradermal and the eye test

A Year in the Open

DURING the year just closing HEBE and its relation to the dairy industry has been brought to the forefront of dairying thought and has been made the subject of considerable discussion. This has resulted largely from the campaign of educational advertising which the Hebe Company has been conducting in this and other farm journals. This out-in-the-open discussion has demonstrated that the opposition to HEBE has been inspired largely either by prejudice, misrepresentation of the facts or misunderstanding of the nature and purposes of HEBE and the manner in which it is being advertised and marketed.

During this discussion many questions have been asked and answered and many charges reflecting against the product have been aired and refuted.

Although presented in a variety of forms the charges against HEBE, when reduced to fundamentals resolved themselves into these two points:—

1. The belief that HEBE will injure the dairy industry by being marketed as a substitute for evaporated and condensed whole milk.
2. The belief that in HEBE skimmed milk is used simply as a means of bringing cocoanut fat on the market in competition with butter fat.

In the advertising published in farm journals and in the correspondence resulting from this form of advertising these points have been answered frankly and fairly. In answer to the first it has been shown that:—

HEBE is *not* being advertised or marketed either as evaporated or condensed whole milk or as a substitute for it or a substitute for anything else—but that HEBE is produced, labeled, advertised and marketed as a new and distinctive product (a compound of evaporated skimmed milk and vege-

table fat) for definite uses (cooking, baking, coffee) and as such is building its own market and thus increasing the general consumption of dairy products.

In answer to the second point it has been shown that:—

HEBE is *not* being used as a means of bringing cocoanut fat to the market but that the converse of this is true—that a small amount of cocoanut fat is merely the vehicle by which a large amount of skimmed milk is being brought to the market as a cooking medium. In the production of every hundred pounds of HEBE, two hundred and ten pounds of skimmed milk and only seven and eight-tenths pounds of cocoanut fat are used. This small amount of non-dairy ingredient is there merely to supply the large amount of dairy ingredient with the shortening and other elements necessary to make it desirable as a cooking medium. The cocoanut fat in HEBE serves a purpose similar to the purposes served by salt in butter and gelatine and flavoring extracts in ice cream—to make the dairy ingredient more readily salable for the uses intended.

As can be seen in this brief review of the year's development in the HEBE discussion the Hebe Company has diligently sought to give to the rank and file of the dairy industry all of the facts by which they may judge the product and know how it will affect their business. It has always been the belief of this Company that the dairy-men should have these facts and that it is for the best interest of the dairy industry as well as the Hebe Company to give the broadest publicity to all matters that directly affect the industry.

It is only partial knowledge that is dangerous and that is why many dairy-men and leaders of dairy thought, after learning all of the facts, have come to see HEBE in a different light in its relation to the dairy industry.

The HEBE situation is discussed at length in the booklet "The Missing Third"—a copy of which will be sent free on request to the Hebe Company, 3273 Consumers Bldg., Chicago.

A recent addition to the herd of Herefords being assembled by William Briggs and Son, Dixon, is the junior bull calf, Beau Prince 33d, that stood first in a class of 22 at the American Royal Livestock Show at Kansas City. This youngster is declared to be one of the best calves shown the past season and it is the intention of Messrs. Briggs to carry him along for the 1921 shows.

R. M. Dunlap, well known livestock man of Sacramento, paid \$1,075 for the two year old Shorthorn heifer, Mina Hedgewood A, sold in the American Royal sale at Kansas City.

A calf club with nine members has been organized at Galt and five Holstein and four Jersey heifer calves have been provided. The Holstein calves were secured from Toyon Farms, the Napa State Hospital and A. W. Morris and Sons. The Jersey calves came from the Thorp herd.

Swine men throughout the state will learn with deep sympathy of the illness of Alex D. McCarty, president of the California Swine Breeders Association and one of the leading Poland China breeders of the West. Mr. McCarty has been confined to his home in San Francisco for several weeks but hopes to make a trip to the Hawaiian Islands to recuperate.

Besides the junior yearling Hereford bull, Beau Blanchard 105th, lately added to the Mission Hereford herd, John A. Bunting reports the purchase of junior bull calf sired by Beau Blanchard.

William Bond and Son, Newark, were buyers at the Shorthorn sale held in connection with the Portland livestock show and secured the following females to add to their herd: Mysie's Queen, Lovely Miss Goods, Rosie Supreme. They sold the following females: Cumberland Maid, a junior yearling heifer sired by Sir Type and out of Gloster's Maidenness, to Day and Rothrock, Spokane; White Cumberland, a senior heifer calf sired by Sir Type and out of Scottish Flower 2d, to D. E. Arthur of Idaho; Cumberland Sunrise, a junior yearling daughter of Sir Type and out of Roan Sunrise, to D. A. McDonald of Washington, and Cumberland Goldie, another daughter of Sir Type, to Warren Pattison of Oregon.

M. E. Prescott, editor of the Holstein-Friesian World, is now in California visiting the leading herds of the state. Prescott attended the sale held last week at Tulare.

A. B. Humphrey, one of the pioneer Berkshire breeders of this state, is making his plans to hold a public sale of breeding stock early next spring. This sale is certain to attract wide attention for the reason that the Grape-wild herd is regarded as one of the top collections of the breed. It has been several years since Mr. Humphrey held an individual sale.

F. Fortini of Orland writes: "It may interest you to know that our herd bull, Dairy Maid's Gay Prince, has been leased by the university farm, Davis, to use on their herd. Dairy Maid's Gay Prince was, as you may remember, grand champion bull at the state fair 1920; he repeated his success at the Glenn County fair, Orland, in very hot competition."

Maid Tushie Segis, one of the six daughters of Allenvall Cornucopia Paul, owned by James J. Jeffries of Burbank, has finished her year with 28,240 pounds of milk and 1,137 pounds of butter. Her seven day record of

pounds day record of 130 pounds are very creditable ones. She is the first one of five sisters now on test to finish and at least two of the others will top a thousand pounds. Howard Koch, who has had charge of these cows for the past two years, believes they form a portion of one of the best herds on the coast. It looks very much like he is right.

The Maxwell Farms at Hollywood are getting a number of daughters and granddaughters of Sir Ormsby Skylark ready to test. Under California conditions they should make dandy records as their sisters and former barn mates, which are being held at Waterloo, Iowa, until they finish their tests, are

What Part of the Farmer's Milk Check Represents Profit?

FOR 180 cows that averaged less than 5,000 pounds of milk annually the part of the milk check that represented profit and reimbursement for the owner's managerial ability was 23 per cent. For 257 cows averaging more than 6,000 pounds annually, the per cent remaining for profit and the owner's skill was 41 per cent.

For the last five years the dairy division, United States department of agriculture, has been making studies which bear on this problem in many dairy sections of the country; and two year investigations on the requirements for producing milk have now been completed on groups of dairy farms in six of these communities. One of the latest of these studies, carried on in Vermont, is the one on which the above figures are based. What it has disclosed in regard to economy of production and the requirements for producing milk may be of value to the dairyman who is interested in finding out where milk returns are going.

These figures which were obtained from a study of the production records of 587 cows which remained in the herds a full year show that the average annual production of the 180 lower producing cows was 4,146 pounds; also that the average production of 257 higher producers was 7,144 pounds a year. After subtracting from 4,146 pounds the amounts of milk required to pay production costs (feed, 1,810 pounds of milk; labor, 806 pounds of milk; and other costs, 570 pounds of milk), only 960 pounds of milk remained for the profit and skill of the owner. For the high producing group, however, 3,074 pounds of milk remained after the following deductions had been made: for feed, 2,302 pounds of milk; labor, 806 pounds of milk; and other costs, 962 pounds of milk.

Here, then, were cows in the same locality, in some cases standing side by side, and all requiring about the same labor; yet some were producing three times as much profit as others, even though they were charged with greater quantities of feed and a large amount of "other costs."

The figures adduced are significant also in that they show that in milk checks size is not always a true measure of real value; but that the per cent of profit, as determined by the cows that are kept, plays an important part.

Requirements for 100 Pounds of Milk

The figures upon which this comparison is based were actual records of production; feed, labor and other costs were obtained by monthly full day visits on each of the farms for a period of two years. Careful records were made on these visits of the daily milk production of each cow, feed consumed, labor required, overhead costs, etc. Using these data, the requirements for producing 100 pounds of milk were worked out. So far as possible the requirements were determined in terms of pounds of feed, hours of labor, etc., so that constantly fluctuating prices would have no effect on the value of the figures. Results may be interpreted at any time by using prevailing prices.

The requirements for producing 100 pounds of milk, based on 847 cows, with an average annual production of 5,252 pounds of 3.9 per cent milk, were as follows: Grain, pounds, winter, 33.1; summer, 8.7; hay and other dry roughage, pounds, winter, 129.9; sum-

mer, 18.7. Silage and other succulent roughage, pounds, winter, 191.3; summer, 27.8. Hauling and grinding concentrates, winter, \$0.020; summer, \$0.005. Bedding, pounds, winter, 11.2. Pasture, acres, summer, .10. Humar labor, hours, winter, 2.07; summer, 2. Horse labor, hours, winter, .6; summer, .4. Overhead and other costs winter, \$0.555; summer, \$0.425. Credit for calves, winter, .025 of one calf; summer, .009 of one calf. Credit for manure, pounds, winter, 382; summer, 56.

HOG FEEDING PROFITABLE TODAY

Corn on hand, is worth as corn just what you can get for it at the elevators. Let us presume that your local elevator will pay you 75 cents per bushel for your corn, regardless of the fact that some of the 1919 crop could have been sold for almost \$2.00 per bushel, and that some owners would have sold for much less than the \$2.00 price had they been able to move it. In other words, let us take a figure which represents somewhere near what it would sell for as corn—then compare that price with what it would be worth converted into pork. The various agencies have determined that 100 pounds of pork should show a profit if it sells for the price of 13 bushels of corn. The 13 bushels of corn would bring, at the above price \$9.75. However, much of the corn consumed by the hogs could have been sold for considerably more than 75 cents per bushel on the days it was fed. In order to show a profit, therefore, the hogs should sell for considerably more than the present selling price of 13 bushels of corn today—and they are doing so.

We have a record corn crop, with a lot of the 1919 harvest in the cribs, and we have a shortage of hogs. Regardless of past losses, which on the whole are compensated by the former profits due to rising prices—we are interested in the present and future. If we fail to feed hogs, our corn will be cheaper because there will be more to go to market direct.

Taking all conditions into consideration, it seems that we are likely to have greater profits in hog feeding in the immediate future than we have seen any time since the profits due to rising prices in the early years of the world war.

"BREEDS OF DAIRY CATTLE"

The department of agriculture is revising a bulletin published in 1917 touching upon score cards and all kinds of information as to dairy cattle breeds. This bulletin is "Breeds of Dairy Cattle," by H. P. Davis.

Breeds of dairy cattle differ in both conformation and general characteristics. Each has been developed for certain ends. In selecting a breed for any dairy enterprise, consideration ought to be given to factors which will make for the success of that particular business.

The prevailing type of each breed and the ideal toward which the breeders are striving are described in this bulletin. Such information, together with a brief history of the origin and development of each breed, should be of value to the breeder in beginning and carrying on his breeding operations.

Only those breeds having a large representation in the United States are included in the discussion.

MEAT EATING

By W. H. Lipman, M. D.

It is often stated that Americans eat altogether too much meat. The same thing has been said many times before about almost every other food. When we begin to look for the facts behind such statements we find that we have searched in vain. These statements undoubtedly date back, at least in part, to the time when certain diseases were supposed to be caused by foods.

Who does not remember that great pugbear—uric acid? We were warned not to eat this or that food, especially meat, because it produced uric acid and uric acid was the cause of rheumatism, but we know better now. We know that rheumatism is an infection, pure and simple, and has nothing to do with any kind of food. We know that a rheumatic joint, so-called, is a joint that has been infected with germs that were carried to it by the blood stream from some other part of the body. In fact, we know that clean, wholesome food, be it milk, meat, spinach or water, or anything, cannot cause disease. It can only do so when contaminated with disease germs.

Quantity Undecided

When we come to the question as to how much or how little of this or that class of food we ought to eat, we find that we cannot draw any general conclusions, first, because science has as yet not positively established just how much heat, energy and tissue building power the various foods possess, although certain arbitrary standards have generally been accepted.

Second, and this is very important, the digestive and absorptive ability of people varies greatly. In other words, while one man might digest and utilize all the value of a certain quantity of a given food, another will utilize only a small part of it.

Third, the needs of people differ as widely as their digestive powers, for example, certain fare will meet all the needs of a banker, editor or stenographer, but would be entirely inadequate for a farmer, blacksmith or a soldier on march.

Feed Patients

There has been a great change in our ideas regarding the feeding of sick people in the past few years. We all remember how we starved our typhoid fever patients by feeding them on nothing but milk. How thin and emaciated they were during convalescence! Seemingly they could not get enough to eat for the next year, but we know better now, and keep them on a generous diet, including certain meats, throughout their illness. As a result, complications have been lessened and the course of illness and convalescence shortened.

Now as to the question of meat eating: As stated before, it is impossible to say that we are eating too much of this or too much of that, as the needs of individuals differ, and although it is quite true that now and then we see someone who eats too much of some kind of food, this does not mean that everybody eats too much.

Comparisons Made

However, we can come to some pretty definite conclusions about meat eating when we study the accomplishments of the people who eat the most meat as compared with those who eat little. The Australians, Americans, Canadians, English, Germans, French and Italians are the heaviest meat eaters in the world, and I think we will all agree that these races have discovered and created everything worth while in science, art and literature, and have made life generally worth living.

It may be a coincidence, but it is worth mentioning that the Australians and Americans consume more meat per capita than any other people, and they surely gave a good account of themselves in the Great War. The authorities are quite generally agreed that the people who eat the most meat have by far the most ambition and initiative and greater resistance to disease than those who eat little meat.

We all remember the classic case of the French and British laborers who were building a railroad in France in the middle of the last century. It was noticed that the British worked better and accomplished a great deal more than the French. For a time

the cause for this discrepancy could not be found until it was discovered that the British ate roast beef every day while the French had meat only once or twice a week. When beef was added daily to the menu of the French their production soon equaled that of the British.

KIND OF SWINE FOR BREEDERS

Swine breeders expect every animal born on their farms to be the best one ever raised, an A No. 1 outstanding champion, and if, according to present standards of breeding, he is not a championship winner, they calmly change the standards to fit the hog—and this is progress. If the animal was admitted to be inferior to the ideal wanted he would not sell for a big price—and that would be retrogression.

The trouble is we want too much and want it too quick. Not every animal is better than its sire and dam, although we should like it to be. By changing our ideals to suit our animals we are sawing off the limb next to the tree. Swine have a tendency when bred for a high dressing percentage to have very fine bone, often so fine they go down on the dewclaws. To get away from this more bone has been favored by judges, which is a good thing. But now we go to the other extreme and try to get a hog's legs as big as possible. Some look like the animals in the "Wizard of Oz." Anyone knows size of bone does not necessarily mean quality of bone—generally the opposite. A big bone is more open and porous than a small one, weighs more, and is not wanted beyond certain limits. Swine breeders cannot overcome rules and laws of breeding simply by convincing

themselves that a thing is what it is not.

Fewer animals kept for breeding and better judgment in choosing them is what we want. Obtaining quantity at the expense of quality is what we don't want. Keep only the best for breeders, sell the others for slaughter—that is progress.—J. E. T. in National Stockman Farmer.

BUTTER, CHEESE AND ICE CREAM MAKERS

The butter, cheese and ice cream makers of California recently gathered in annual convention at Davis. The butter scoring which was conducted during the session resulted in first place going to J. Reichenuth, Bodega Cooperative Creamery, 93.25. Other scores were: Julian Searles, Scott's Dairy, Hanford, 91; Fred Deter, Montague Creamery, 91.75; R. G. McBride, Davis, 91; Orland Cheese and Butter Company, 91.75; F. Simonsen, N. C. M. P., Orland, 92; G. R. Jaehnig, Davis, 92.50; W. P. Evarts, N. C. M. P., Sacramento, 91.50; A. Wirz, Hollister Creamery, 91.50; Napa Riverside Creamery, 92.25.

Cheese scores above 90 were made by N. C. M. P. Assoc., Sacramento, and university farm creamery at Davis.

The event ended in a banquet at which Sam Greene of the California Dairy Council and Dean Van Norman of the farm school made addresses.

ECZEMA

Some cases of eczema are very obstinate. Give the horse a pound of Glauber salts dissolved in two quarts

of water to clear the waste material out of the bowels. Repeat every week. Be careful about the ration. Limit the hay to one pound per 100 pounds live weight daily and feed in addition to the grain ration of corn and oats a handful of oil meal at each feed. If scabs have formed, soak in sweet oil and three or four hours after application wash with warm water with enough castile soap added to make the water soapy. After the scabs have been removed apply twice a day an ointment of vaseline six ounces, sulphur two ounces, zinc oxide one ounce.

JAMES J. JEFFRIES TO SELL HOLSTEINS

The sensational announcement of the present year in Holstein circles is the dispersal of the famous herd owned by James J. Jeffries, Burbank. Every animal in the herd will be sold, including the great herd sire, King Segis Pontiac Jannek, and all of the wonderful show herd that made such a splendid showing at the last Los Angeles Livestock Show. The herd numbers 75 head and will be sold on Jeffries Ranch, Burbank, on Thursday, February 3, 1921.

HOLSTEIN BREEDERS TO MEET

Holstein breeders of Southern California are to meet at the ranch of James J. Jeffries at 10 o'clock Saturday of this week, December 11. Mr. Jeffries will provide a barbecue lunch, after which there will be a meeting of interest to Holstein breeders and an inspection of some of Jeffries' blue ribbon winners, and auto trips to the Hartsook and Maxwell ranches. A wire from M. S. Prescott, editor of the Holstein World, announces he will be here in time to attend this meeting.

OLYMPIC DAIRY FEED

Stands the Cream Separator Test

QUALITY and quantity of milk production determine dairy profits—not the price you pay for feed. Economy begins at the feed trough—not at the feed store.

You cannot compare dairy feeds on the basis of *first costs*. Base your calculations upon the health and strength of your cows, upon the length of their productive life, upon the amount of milk flow, upon the per cent of butter fat, and, finally, upon the price your product brings on the market.

The Result Will be Your Choice of OLYMPIC Dairy Feed

OLYMPIC Dairy Feed contains 1,000 pounds of the high concentrates to the ton, and is compounded upon the same standard of balance as the feed adopted by the Dairywomen's League of New York State during the war, after exhaustive tests and scientific experiments.

Made from properly balanced proportions of Ground Barley, Ground Oats, Linseed Oil Meal, Cotton Seed Meal, Soybean Meal, Corn Feed Meal, Wheat Bran, Corn Gluten Feed and Coconut Meal, five of which are the highest protein constituents now on the market.

IF YOUR DEALER HASN'T OLYMPIC DAIRY FEED, ADDRESS

The Portland Flouring Mills Co.
Merchants Exchange Building
San Francisco, California.
C. B. Sharp, Agent.

Other OLYMPIC Feeds Are

- Calf Meal
- Hog Feed
- Stock Feed
- Horse Feed
- Molasses Feeds
- Scratch Feeds
- Egg Mash
- Crate Fattener
- Molasses Dairy Chop
- Pigeon Feed

Big Type Poland Chinas at Auction

On account of changing my location, I am offering 60 head of Polands at public auction, at

Orland, Cal., Wednesday, Dec. 15th, 1920

The offering includes 30 spring gilts, 10 fall gilts, 10 tried sows and 10 young boars sired by Long Jumbo, Glenn Chief, Yates Big Orphan, Young Hadley and bred to Yates Big Jones, Y. C. 4, Reformer, and Black Bob. Send for catalog.

R. J. Yates

Orland, Cal.

600 Purebred Polands

Sows With Litters Sows Ready to Farrow

Gilts of All Ages Feeders

== AT BARGAIN PRICES ==

Take as many as you like. Lack of room requires us to discontinue our commercial piggery and you can benefit by acting quickly.

Weaned plgs, both sexes, from sows that farrow large litters and raise them. Priced at a figure any farmer can afford and that will show him a profit.

Alex. Wilson, Supt., Guasti, Cal.

\$4000 Top for Vogel

A large crowd of farmers and breeders attended the semi-dispersal sale of H. E. Vogel at Fresno, Wednesday, December 1. The offering was of high quality and was presented in good condition. The feature of the sale was the 35 pound grand champion cow, Betsy Lamb Prilly. After a spirited bidding contest she was sold to A. W. Morris and Sons, Woodland, for \$4,000, that being the top price of the sale. Betsy is conceded to be one of the great cows of the breed. Morris and Sons secured five of the choice animals of the sale. Frank Helm, Fresno, was the heaviest buyer, taking a total of 13 head, including several of the tops. The Pottenger Sanatorium Company, Monrovia, J. D. Crawford, Fred Hansen and G. W. Fink, Fresno, were each heavy buyers. A total of 70 head sold for an average of \$405. That average included a number of young calves and also a number of cows sold at the close of the sale without health certificates. The top 25 females sold for an average of \$735.

The sale, which was held under the management of C. L. Hughes of the California Breeders Sales and Pedigree Company, made available to many buyers a very typy and desirable lot of breeding material from what is generally rated as one of the most substantial herds in the West.

Col. Ben A. Rhoades of Los Angeles was the auctioneer and he was assisted by Geo. W. Bell of Tulare. A representative list of sales follow:

- 1, Betsy Lamb Prilly, April, 1913; A. W. Morris & Sons Co., Woodland; \$4,000.
- 2, Imperial Bonita Mead, March, 1916; Fred Hansen, Fresno, \$650.
- 3, Miss Aralla Pontiac Burke, November, 1914; Pottenger Sanatorium Co., Monrovia, \$615.
- 4, Princess Valley Mead Walker, February, 1915; A. W. Morris & Sons, \$460.
- 5, Princess Aaggie Mead Walker, December, 1919; A. W. Morris & Sons, \$1,000.
- 6, Theta De Kol of Linwood, April, 1914; Fred Hansen, \$550.
- 7, Princess Wynima Pontiac, May, 1913; Frank Helm, \$450.
- 8, Lady Korndyke Morco Alcartra, June, 1917; G. E. Davenport, Fresno, \$200.
- 9, Kathleen La Verne, May, 1916; Frank Helm, \$725.
- 10, Fidella Korndyke, January, 1914; Pottenger Sanatorium Co., \$475.
- 11, Fidella Alcartra of Westlawn, October, 1917; A. W. Morris & Sons, \$400.
- 12, Oaklane Rector Flyke, May, 1912; Jack Borge, Dos Palos, \$275.
- 13, Westlawn Mayzell De Kol, February, 1918; Pottenger Sanatorium Co., \$310.
- 14, Roquette Burke De Kol, February, 1914; Jack Borge, \$310.
- 15, Westlawn La Polka Burke, December, 1917; J. D. Crawford, Burrell, \$350.

- 16, Princess Luana of Westlawn, May, 1914; Frank Helm, \$700.
- 17, Drussa Bona De Kol, September, 1913; Frank Helm, \$700.
- 18, Eva Riverside of Tuolumne, May, 1913; Pottenger Sanatorium Co., \$640.
- 19, Eva Aaggie Riverside, January, 1916; J. D. Crawford, \$535.
- 20, Eva De Kol Segis, September, 1917; Bridgford Holstein Co., Patterson, \$600.
- 21, Westlawn Charmian, December, 1917; J. D. Crawford, \$275.
- 22, Westlawn Segis De Kol, November, 1918; J. D. Crawford, \$235.
- 23, Queen Fidella De Kol, June, 1917; G. W. Fink, Fresno, \$190.
- 24, Lorene of Westlawn, May, 1918; A. De Wolfe, Ripon, \$210.
- 25, Lady Alice Juliana Burke, April, 1914; Pottenger Sanatorium Co., \$615.
- 26, Lady Jane Burke, April, 1914; H. De Wolfe, \$660.
- 27, Burke Mechthilde Fancy, March, 1917; Chas. P. Novels, Long Beach, \$710.
- 28, Westlawn La Polka Kathleen, June, 1917; J. D. Crawford, \$510.
- 29, Hermiana Ceres Chruela, September, 1913; A. E. Marsh, Kerman, \$200.
- 30, Ideala Newtonla, June, 1911; J. D. Crawford, \$260.
- 31, Fidella Cloverleaf Jullanna, April, 1912; Fred Hansen, \$250.
- 32, Autumn Bud of Sunnyside, November, 1911; F. W. Bishop, Fresno, \$210.
- 33, Westlawn Fidella Alcartra, November, 1917; Frank Helm, \$250.
- 34, Westlawn Gwemmar Alcartra, November, 1917; Frank Helm, \$240.
- 35, Cupid Ideal, October, 1916; Milne Bros., Riverdale, \$325.
- 36, Vera Lloyd, August, 1916; Chas. Novels, \$400.
- 37, Westlawn Princess Aralla, December, 1917; Frank Helm, \$300.
- 38, Confidential Cloverleaf, December, 1914; Frank Helm, \$975.
- 39, Confidential Aralla De Kol, August, 1917; Chris Thompson, Tranquility, \$260.
- 40, Arline Bona De Kol, December, 1913; Frank Helm, \$300.
- 41, Oma Eltina, January, 1915; Pottenger Sanatorium Co., \$290.
- 42, Princess Fidella Juliana, December, 1914; W. M. Barcus, Fresno, \$195.
- 43, Princess Kwemmar, March, 1917; Bridgford Holstein Co., \$500.
- 44, Fidella Claudine, March, 1916; J. V. Masten, Fresno, \$210.
- 45, Westlawn Primula Pontiac, February, 1917; J. D. Crawford, \$350.
- 46, Belle Segis of Linwood, April, 1917; J. D. Crawford, \$300.

- 48, Liffretta Korndyke Pletje, March, 1911; W. W. Beard, Kerman, \$300.
- 49, Mercedes Korndyke De Kol J. hanna, 3rd, December, 1915; Chris Hansen, Tranquility, \$405.
- 50, Minnie Korndyke of Nevada, February, 1915; Z. T. Withrow, Fresno, \$210.
- 51, Woodlawn Cornucopia Josephin August, 1919; Frank Helm, \$250.
- 52, Astrea Segis Pontiac, March, 1920; Chas. P. Novels, \$320.

BULLS

- 1, King Prilly Mead, April, 1919; Rot T. Curtis & Sons, Exeter, \$400.
- 2, Westlawn Kathleen Mead, January, 1919; Frank Helm, \$285.

Milo Proves Welcome Immigrant

MILO, the sorghum grain crop which was introduced into this country—probably from Africa—about 1880, has come to stay. The bureau of plant industry, United States department of agriculture, advances the statement that milo produces better yields than any other grain sorghum in those sections of the sorghum belt where the rainfall is low and the altitude high. So definite is its adaptation to these conditions that milo sowing has practically ceased in South Carolina and Georgia, where it was first introduced, and is now confined to the Southern Great Plains area and the far Southwest. Here moisture and altitude give the grain a better environment. Here also milo furnishes an essential grain crop under conditions too severe for corn. Its use is limited to the South and Southwest. Selection Eliminated Faults

The usefulness of the improved milo with its short, single stem and its single, erect, heavy head is well appreciated. As introduced, milo failed in many desirable points; the stems were of unequal height, and the heads were partly erect, partly leaning, and partly hanging or goose necked. Selection has eliminated most of these faults and there is little physical resemblance between the original type and the improved one.

In 1899 about 25,000 acres of milo were grown in this country, and the crop was worth \$200,000, but in 1918 a crop of 1,205,000 acres was grown, and the yield that year was valued at \$21,300,000. No better testimonial need be offered. At a department of agriculture field station in the Texas Panhandle, Standard milo, over an 11

year period, gave an average yield of 20 bushels to the acre. The Dwarf variety, at the same station and for the same period, yielded 24 bushels to the acre.

Chemical analysis shows that milo grain contains 9.31 per cent water, 1.61 per cent ash, 1.99 per cent nitrogen, 12.49 per cent protein, 71.83 per cent carbohydrates, 3.22 per cent fat and 1.48 per cent fiber. For purposes of comparison the average content of corn follows: 10.60 per cent water, 1.50 per cent of ash, 10.30 per cent of protein, 70.40 per cent of carbohydrates, 5 per cent of fat, and 2 per cent of fiber.

Milo is seen to have a higher protein and carbohydrate content than corn, but its fat percentage is low. As fat is the most valuable part of the grain for fattening stock it is a parent that milo falls a trifle below corn for this purpose. Experts agree that milo has about 90 per cent of the feeding value of corn. As food for humans, it is about equal to corn.

Cutting Off the Heads

Where the planting is small the common method of harvesting is to cut off the heads with a knife and to pile them into a wagon. The heads are then cured by piling in windrows or a better method—by putting them in well ventilated bins. A corn bind which cuts and binds the stalks can be used or the milo may be harvested with a grain header.

The grain is larger and softer than wheat. It is threshed as wheat, threshed but with the cylinders revolving at only two-thirds the speed used for wheat, and sometimes with fewer teeth in cylinder and concaves. The precautions are necessary, says F. H.

rs' Bulletin 1147, to prevent the milo rains from cracking.

Ground milo heads (head chops) or he ground grain (milo chops) is fed o cattle, sheep, hogs and poultry as or is fed. It is also fed in the undle as roughage. For most purposes it should be cracked or ground and should be balanced with other eeds rich in protein, alfalfa, clover, cottonseed meal or the like.

POSTERIOR PARALYSIS IN SWINE

Swine breeders are becoming much concerned with a condition often ound in hogs known as posterior aralysis.

In such a condition the animal par- ally or totally loses control of its ind quarters; otherwise, it remains pparently healthy.

When seeking the specific cause of he affection each of five factors may e considered as the source of dis- urbane:

First, injuries received from large nimals running in the same lot or asture or otherwise.

Second, impaction of the posterior arge bowels with masses of dung hich may produce pressure on the essels and nerves in the pelvic or hip egion.

Third, kidney worms (Stephanurus entatus). Although this worm is not ound to any great extent in California vertheless it is accountable to a arge degree for such conditions in ome sections of the country and ould receive consideration especially n autopsy.

Fourth, heavy suckling. The brood ow either may not be receiving a roper ration or there may be defec- ive assimilation and consequent fail- re to absorb the nourishment required oth for the maintenance of herself nd her pigs to compensate the "usual apid growth."

Fifth, rheumatism or lumbago. This ay be produced in hogs that sleep n damp quarters either in pens, ma- ure piles, or hay stacks. A board off he cot may permit a draft to blow on he sleeping hog and produce a weak- ned condition of the loins.

Some persons consider a hog quite esistant to cold because of the thick yer of fat under the skin. This is a mistaken idea and many swine affec- ions can be prevented by supplying he animals with comfortable quar- ers. (S. O'T.)

HOME TANNED HIDES GIVE UNCERTAIN PROFIT

Apparently it doesn't pay the farmer o tan his own leather. The bureau of hemistry, United States department of agriculture, is conducting leather naking experiments upon the scale to hich the average farmer would have o adjust his work, and specialists say hat the results obtained thus far do ot warrant general practice. Good eather can be made in individual tan- eries, but the results are too uncer- ain to give reliable profits.

The work was taken up by the de- artment when it became evident that he farmers were feeling the injustice of a transaction wherein they sold a whole cowhide for less than they paid ut for a pair of work shoes. Investi- gation shows that the leather dealer is ot entirely to blame for the low rices that the farmer receives for his ides. Too often the hide from the arm cow is taken off in a careless manner that leaves the skin full of uts and holes—farm hides are never as uniform as those bought from the acking houses where the animals are arefully graded and the skins re- moved by expert skimmers. For that eason the hide buyer is always will- ing to pay more for the packer's pro- duct than he can offer the farmer.

Then, too, the farmer sells his cow- ide to the junk dealer, who deducts his profit from the price he pays. Whenever it is possible to collect a umber of hides and skins it will pay he owner to deal directly with a large ealer, the specialists say.

USE THE RANGES

The United States department of griculture has issued Circular 134 hich touches upon livestock grazing s a factor in fire protection in na- ional forests. It has often been on- sidered that such grazing was quite he opposite of protection, but the enefits as determined by experts of

the department are summarized in tht following conclusions:

Recognizing the value of normal grazing in fire protection of timber- lands a study of its application to the national forests suggests:

Timely use of present ranges or the removal of rank vegetation before it becomes unpalatable.

Utilization of all suitable unused lands by the development of water and trails and the elimination or control as rapidly as possible of all factors hich prevent present use.

Closer consideration of the class of stock to be grazed where fire protec- tion is involved.

Location of driveways and trails so as to form the most efficient fire lines and means of communication.

Overgrazing of strategic points. Minor damage at such point may re- sult in saving large areas of forest from destruction by fire.

Study of lightning fires on the for- ests with a view to determining whether lightning zones exist and whether grazing may be made to assist in preventing the spread of fire.

Fuller enlistment of the moral and active support of some 25,000 addi- tional persons in the forests on ac- count of grazing uses.

Closer correlation of the livestock industry of the forests with the fire protection plans.

Veterinary

Scours

I have a mare ten years old which has had scours continually for the last six months. Previous to that time she was subject to it at certain times. Aside from the scours she appears very well. She is in very good condition. She eats and drinks heartily and is fed altogether on barley hay. Since she feels so well it does not seem possible that the trouble could be indigestion. Will this condition cause indigestion in time? Is it advisable to use some remedy to correct this trouble and if so what would you advise?—Subscriber, National City.

It would seem from the description of the trouble that there is a very strong possibility that your mare's teeth are at fault. I would suggest that the best thing for you to do would be to consult a veterinarian and have him float the teeth. The food is probably not being sufficiently masticated. There are, however, a number of other conditions that might cause the above mentioned trouble. Some horses are more or less predisposed to trouble of this kind. I would suggest that you do not give feed or water just before using but give the feed and water as long as possible before the horse is to be put to work. It might be desirable to give a purgative for this purpose and in a case where this trouble has been hanging on as long as you state, castor oil would be the best although raw linseed oil may be used. You can give about a pint or pint and a half of either, as a drench. If it is necessary it can be mixed up with milk or warm water. This will probably not be necessary, however. This should be followed by the use of easily digested feeds which should be given sparingly. It would perhaps be well to give the animal only lukewarm water as cold water will sometimes prove slightly irritating. If the purging continues it can sometimes be checked by giving a little wheat flour in water or by giving the animal starch water to drink. Some medicines may also be given but if the above mentioned remedies are not satisfactory it would be advisable to consult a veterinarian.—G. E. G.

MULLET IN SALTON SEA

Referring to your article on the mullet fisheries of the Salton Sea in November 20 issue, the theory of the fish coming into this sea by swimming up the river from the Gulf of California is not only plausible but quite probable; for many mullets and some sheephead come up the Withlacoochee River in Florida from the gulf, some 50 miles.

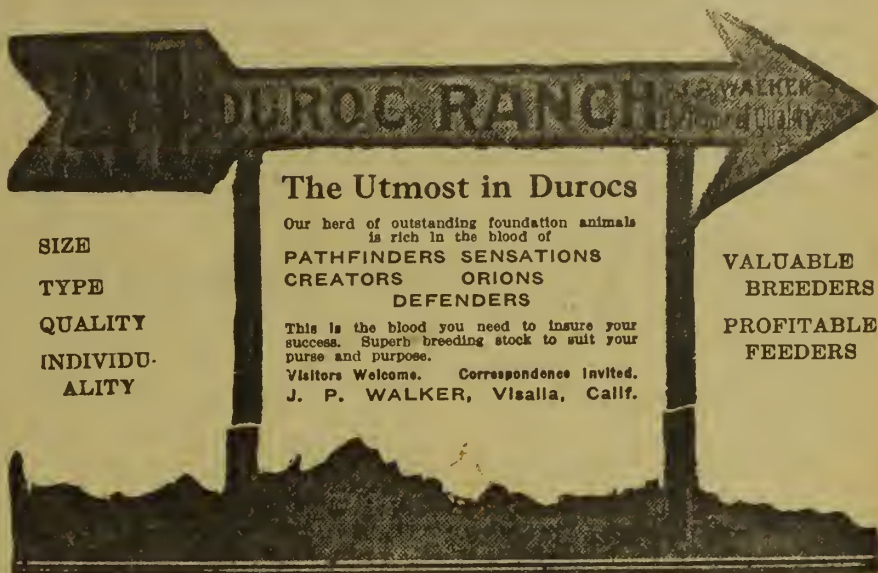

The writer has speared many mul- lets from a boat at night in the waters of Blue Spring, a tributary of this river, whose water is as clear as crystal and from eight to 12 feet deep. —R. R. Snowden.

Duroc-Jerseys Are Prolific and Profitable

They raise big families. Hardy, easy-feeding, quick maturing. That is why Duroc-Jerseys today outnumber any other breed in the United States. Out of all the hogs marketed in 1918, 51 per cent were Duroc-Jerseys.

WRITE FOR BOOKLET—"DUROC-JERSEY HOGS ARE PROFITABLE" published and mailed free by the largest swine record association in the world (over 10,000 members) for the benefit of hog raisers everywhere.

MAKING IMPROVEMENT

The owners of Shorthorn herds are generally building on a permanent basis. They are constantly working for improvement. There never has been a more universal endeavor among breeders to raise the standard of their herds than the Shorthorn breeders are putting forth at this time.

The Shorthorn is the breed for you because it excels in beef production and in milk production also.

Ask for literature. AMERICAN SHORTHORN BREEDERS' ASSOCIATION, 13 Dexter Park Ave. Chicago, Ill.

ifornia.

errydale Berries and Roses—"De Roo's
Mary Lewis" New Everbearing Rasp-
berry. The finest, largest and best flav-
ored berry grown. Can ship 500 miles
in perfect condition. Plants strong and
need no supports. Plants ready for deliv-
ery now. Price per 12, \$3.00; 100,
\$20.00; 1,000, \$150.00. Sample plant 30
cents, parcel post. Write for catalogue,
sent on receipt of 5 cents in stamps.
Desires wanted. Our salesmen are
taking good up to \$600.00 per month
at **ERRYDALE GARDENS**, Dept. D, 1715
Cobster Street, San Francisco, California.

awberries—1,000,000 plants, leading var-
ieties; 200,000 Cuthbert raspberry; 100,
000 Black Cap; 100,000 Loganberry
etc. Order now; low prices. Also 100,000
peach seedlings—will graft in
pines or prunes on contract for fall deliv-
ery 1921. Lafayette Nursery Company,
Lafayette, Oregon.

For Sale—Best rooted grape vines of
Thompson, Malaga, Emperor, Sultana,
Muscat and Fig Trees of Calimyrna,
ack Mission, Adriatic and red wonder-
ful Pomegranate Trees at cheap price.
This stock is growing at Madera, Delano
and Cutler. P. O. Box 695, Dinuba, Cal-
ifornia—S. K. Hahn and Company.

erry Plants—Strawberries, Loganber-
ries, Currants, Gooseberries, Blackber-
ries and Raspberries, for immediate deliv-
ery. All stock first class and strictly true
name. Write for prices. M. J. MONIZ,
erry Specialist, Sebastopol, California.

etpald, Brandywine 1.75; Oregon and
Ettersburg 80, \$2.00. Booking orders
for Corys and Burbank Thornless, 35,000
each. Order quick. Bishop's Nursery,
Bghland.

erry Winningstadt Cabbage Plants,
strong and healthy stock, \$3.00 per
100. Moss curled parsley, \$4.50 per
100. M. Pazos, 1639 E. 53d St., Los An-
ges.

andywine Strawberry Plants from
stock which produced \$3,000 worth of
ries from acre this season. Price
asonable. Lon King, 1158 West Fourth,
verside, California.

ubarb Plants—Wagner's Giant 1 year,
per dozen 50c; per hundred \$4.00. Wag-
ner's Giant, 2 year, per dozen \$1.00; per
hundred \$8.00. Seed per pound \$5.00.
errier Bulb Co., Santa Cruz, California.

erry Thornless Mammoth—Largest and
est blackberry; ripens early; few seeds.
rite for descriptive price list. Get
ants from William Mortenson, Route
Box 209, Lodi, California.

awberries six months in the year.
Plant Everbearers, Superb, Progressive,
nericus, \$250 per hundred prepaid.
atalogue. Fred Leissler, R. 6, Box 429,
attle, Washington.

For Sale—Mariout Seed Barley. Good
strong seed and free from foreign seeds
dirt. Price \$5.00 per hundred pounds.
and cash with order. Fairdale Farms,
F. D. 1, Ferris, California.

awberry Plants For Sale—First year's
growth and well rooted. Marshall and
proved New Oregon. Write for price.
Christiansen, R.F.D. 2, Canby, Oregon.

For Sale—Mountain grown strawberry
plants. Brandywine \$1.50 and Banner
00 per hundred by mail postpaid. B.
yan, Camp Baldy, Calif.

awberries—Wm. Belt, best among 15
varieties tested. Two dollars per hun-
dred fifteen per thousand. Gervais Nur-
ery, Terra Bella, California.

mpkin Seed—Mixed Pumpkin Seed,
good germination, 25c per lb. Aurora
ed Mill, Stockton, California.

For Sale—Unrooted grape cuttings, fruit
trees, rooted grapevines. Burke's Nur-
ery, Lodi, California.

ne Klondyke and Brandywine plants for
sale, \$12.00 per M. L. E. Hall, R. D.
2, Box 61, Pasadena, California.

awberries—Plant 'em now. Cash
Nurseries, Sebastopol.

MISCELLANEOUS

PROTECT PRUNING CUTS

ee cuts or wounds, if left exposed, are
ry likely to become infected. Prevent
fection by prompt application of PABCO
RUNING PASTE. Ask your dealer.
Manufactured by the Paraffine Compan-
y, Inc., San Francisco, California.

INSURE YOUR TREES AGAINST INFECTION

ur orchard is a valuable investment.

Crowe Hardware & Electrical Works,
Phone 90, Tulare, California.

For Sale—Rebuilt windmills, tanks,
pumps, irrigating pipe fittings, cylin-
ders, rods, valves.

WHY PAY MORE?
New 1,000 gal. galv. tanks, \$49.25; 2,000,
\$69.25. Used material absolutely cheap-
est good servicable machinery can be pro-
duced for. Also buy. Demmitt Co.'s of-
fice, 120 N. Main, Los Angeles.

For Sale—10 ft. Superior Drill. Two
power lift tractor plows. Tractor dou-
ble disc harrow. Drag harrow, three
walking plows, spring tooth harrow. New
and slightly used. See us when in the
city. Cheap for cash. ARNOTT & COM-
PANY, 112 So. Los Angeles Street, Los
Angeles.

New Gas Engines For Sale—Have several
engines from 6 h. p. to 16 h. p. equipped
with oil burner attachment for sale at
cost. Installing motors and cannot use.
Address Box 655, Cultivator, Los Angeles.

For Sale—Kirstin One Man Stump Puller
as good as new. Have no more use for
it and will sell cheap. Address P. O. Box
341, San Fernando, California.

For Sale—Merry Garden Tractors. Circu-
lars and demonstration free. Dwight
E. Smith, L. A. County Agent, 1645 North
Normandie Avenue, Los Angeles.

For Sale—At low price, Utilitor tractor,
complete equipment, practically new,
first class condition. W. M. Booth,
Downey, California. Phone 692.

For Sale—Saunders 50-inch tractor disc
plow in good shape; \$250 cash. Flem-
ing Bros., Friant, California.

For Sale or Exchange—2 ton truck in
good condition, \$800. Would consider
orchard tractor. Box 333, Placentia.

bred stock for sale at all times. J. J.
Prendergast, Redlands.

WANTED

Practical Farmer and Orchardist—Prefer-
ably married man, with some ready
cash; to locate on and cooperate with me
to clear, plow and plant 60 acres choice
fruit, grape and nut land, 10 minutes west
of Paso Robles, San Luis Obispo County,
joining famous "Laderwiski's Ranches,"
Midway between New Oil fields at "San
Miguel" and "Carisa Plains" where three
large Oil Syndicates expect to strike
"gushers." Fine proposition for a hus-
tler. C. C. Wilmot, 437 South Broadway,
Los Angeles.

Wanted Ten Thousand Good Dairy Cattle
to consume our surplus alfalfa hay.
Dairy opportunities unexcelled on the
Newlands Irrigation Project. Never fail-
ing water supply. Adequate storage.
Mild climate. Good dairy market. Great
variety of crops. Our alfalfa hay unex-
celled in feeding value. Supplements not
essential. Orders handled: Leasing or
feeding contracts available. Address
Newlands Project Alfalfa Association,
Fallon, Nevada.

Wanted—Walnut Meats. Fred L. Mit-
chell & Son, 214 French Street, Santa
Ana, Phone 551-M.

Wanted—To hear from owner of land for
sale. O. K. Hawley, Baldwin, Wisconsin.

GOVERNMENT LAND

300,000,000 Acres Free Land in U. S.—
Send for free descriptive circular of our
100 page book THE HOMESEAKER
which tells you where this land is and
how to acquire it, or send \$2.00 for book
direct. The Homeseeker, Dept. M, 336 S.
Broadway, Los Angeles, California.

For Sale—Government irrigated lands.
Dry farm lands, stock ranches and city
property. For information about the
United States Government Project at Or-
land and prices on fruit and alfalfa farms
and dairy ranches write to Collier and
Leonard, Orland California Box 164

HORTICULTURAL PRINTING

ery, seed and florist trade; half tone cuts
of many standard plants. Correspond-
ence invited. The Kruckeberg Press,
237-241 Court St. Los Angeles

FERTILIZERS

Gypsum and Lime—Price Right
Order early for prompt delivery
E. B. Matthews, 1010 N. Madison Ave.,
Pasadena.

FARMS NOT WEARING OUT

We often refer to some crops such
as potatoes "running out," to our lands
as depreciating in real producing value
and sometimes infer that generally we
are on the downward grade, but we
note in report of agricultural college
extension service of the state of Ohio:

Ohio's crop yields have increased
approximately 20 per cent in 20 years
according to the recent census. Bet-
ter farming methods are declared to
be showing results. For the ten years
preceding 1900 the average yield of
wheat per acre in the state was only
14.7 bushels; for the ten years preced-
ing 1920 it averaged 17.1 bushels. With
oats for the ten years preceding 1900
the average yield was 30.5 bushels;
for the ten years preceding 1920 it was
36.4 bushels. With corn, which occu-
pies more acreage than any other crop
in the state, the average yield for the
ten years preceding 1900 was 31.4
bushels; for the ten years preceding
1910, 35.6 bushels, and for the ten
years preceding 1920, 38.5 bushels.

"Drainage, rotation, better seed,
fertilization and cultivation are lead-
ing to increased yields," says Dr. J.
I. Falconer of the college of agricul-
ture. "That it is still possible to
considerably increase the crop yields
of the state is shown by experiments
at the Wooster experiment station,
where yields of nearly twice the state
average have been secured for the
past ten years. If the prices of farm
products are sufficient to justify the
expenditure of labor and capital, the
agricultural output of Ohio could be
easily increased by 25 per cent in the
next ten years. Whether or not this
will be done will depend largely on the
prices received for the products of
the farm."

We think the census will also show
that as to California there is a de-
cided upward trend in acreage as well
as total production.

ALASKAN WOOD PULP

Cheap paper and print are essential
in these days for human progress.
Therefore, the recent visit of Chief
Forester Greeley to Alaska is perhaps
as important as many things that fill
pages in our newspapers. It turns out
that our Alaska, which we bought for
\$7,000,000 only 53 years ago, has more
than 100,000,000 cords of pulpwood
now standing, and can produce 1,500-
000 tons of paper annually under sci-
entific forest management. If this
hitherto neglected resource of Amer-
ica is vigorously developed and the
cost of paper is brought down to five
cents a pound or less, no mathemati-
cian can estimate what it means to

this nation in years to come. Simply
in dollars and cents, however, it would
pay the total cost of Alaska 21 times
over every single year for all time to
come.

Californians are now constructing
the first Alaskan pulp plant at Snet-
tisham (the Alaska Pulp and Paper
Company). They begin with 100,000-
000 feet of pulpwood bought from the
forest service. It is also said that
there is pulpwood to supply at least
six large mills at various points on
Puget Sound.—Charles H. Shinn.

EAT MORE RICE

Some people do not like rice. This
is largely because they do not know
how to cook it properly nor how to
combine with other foods. When prop-
erly prepared there is no better or
cheaper food and no other can equal
its combination of deliciousness, econ-
omy and high food value.

It will also interest many to learn
that here in California we grow a type
of rice which is the finest cooking rice
produced anywhere. The reason it is
not more popular is because most of
us don't realize that our Golden State
short grain rice is superior to the long
grain rices of the Orient and the South-
ern states. The mellow, sweet Cali-
fornia rice meets with instant demand
wherever its qualities are understood,
and there is no food superior in flavor
and wholesomeness to our own rice.

DEEP EYED POTATOES

After three years' work at the Mon-
tana experiment station with a deep
eyed potato variety in an endeavor to
improve the commercial value by se-
lecting to a shallower eyed type, the
yielding power was greatly reduced,
and careful field counts showed 90 per
cent of the plants to possess degen-
erate tendencies. Studies of hills and
tuber characteristics in seed plats
planted in 1919 on a tuber unit plan
and classified as normal vigorous,
intermediate, and degenerate, showed
conclusively that shallowness of eye
was correlated with degeneracy. In
practically all varieties, the most per-
fect tubers as regards size, form and
depth of eye, came from intermediate
plants, while in advanced degenerate
types the depression about the eye was
often entirely absent.

Tests were also made to determine
the value of thinning as a substitute
for seed pieces of uniform size. All
hills were thinned to a single stem
as soon as the plants were large
enough to pull. Plats planted with
seed pieces averaging 1.04 ounces gave
average yields of 20,575 pounds of mar-
ketable tubers per acre, while those
planted with seed pieces weighing 0.33
ounce yielded 19,447 pounds per acre.
On other plats 1.3 ounce seed pieces
yielded 17,867 pounds compared with
16,097 pounds from 0.33 ounce seed.
Field counts before thinning showed
plats planted with 1.3, 1.04 and 0.33
ounce seed to average 2.27, 2.22 and
1.47 stems per hill, respectively. Re-
sults, though not conclusive, show
that variations in yield following plant-
ing of large and small seed pieces are
largely a matter of stand, i. e., the
number of plants produced per seed
piece planted.

DUCKS DESTROY MOSQUITOES

Experiments and observations by
such scientists as McAtee, Lockwood
and Dixon have proven that ducks
may play an important part in the
struggle against malaria. As soon as
they are hatched the ducklings wander
over to the pools and feed on the
larvae of insects, among which are
those of the anopheles mosquito. Duck
breeding for this purpose has been of-
ficially recommended in Indo-China for
the most unhealthy regions of Tonkin,
Eastern Cochinchina and Cholon.

Estimates that the tentative Boulder
Canyon dam project on the Colorado
River basin would cost at least \$75-
000,000 have been laid before a confer-
ence here of the boards of directors
of the Coachella Valley Water Users
Association and the Imperial Irriga-
tion District by Arthur P. Davis, direc-
tor of the United States reclamation
service.

The state fish and game commission
is proposing to ask the legislature to
make a game sanctuary in Butte and
Yuba Counties. The proposal is to
take in a 20,000 acre tract.

GERMOZONE

"the Best Remedy for
Poultry and Pet Stock"

The old reliable, proven remedy for Roup, Colds, Canker, Swelled Head, Bowel Trouble, Snuffles, Wounds, Sores, Loss of Fur or Feathers, Skin Disease, Etc.

H. A. Kiewert, 5042 N. Long Ave., Chicago, Ill., says: "I had some of the worst kind of cases of rump in my chickens and I thought I would not save any but I have saved these birds, thanks to Germozone." H. A. Haines, Rosalia, Kas.: "If we had tried Germozone at first it would have saved us \$1,000 worth of expensive experiments." Mrs. T. A. Morley, Gallen, Mich.: "I have used Germozone 17 years and could not get along without it." E. W. Thiel, Waukesha, Wis.: "I have used your Germozone for white diarrhoea in baby chicks and sure got wonderful results. I also use it right along on grown fowls."

Germozone is sold by most drug, seed and poultry supply dealers, or mailed postpaid in 25c, 75c and \$1.50 packages, from Omaha. Poultry Book and Book on Diseases FREE.

Save Money—Buy Pipe From Us

Farmers, Miners, Builders—people in
every kind of business are saving money
buying used or renewed pipe from us.
We sell every kind of pipe. Send in a list
of your requirements today and get our
prices. We have saved hundreds of peo-
ple 33-1/3 to 50 per cent on their pipe
bills. Here's a partial list of some of the
miles of pipe we have in stock for im-
mediate delivery:

8,000 ft. 6 Inch Riveted 16 Gauge
700 ft. 8 Inch Riveted 16 Gauge
5,000 ft. 12 Inch Riveted 12 Gauge
1,000 ft. 18 Inch Riveted 12 Gauge
800 ft. 22 Inch Riveted 14 Gauge
300 ft. 24 Inch Riveted 14 Gauge
500 ft. 36 Inch Riveted 12 Gauge
10,000 ft. light wrought iron 8 Inch
pipe with cast iron collars.

All above pipe thoroughly overhauled
and inspected and ready for immediate
use.

We also have large quantity standard
pipe and screw casing, pressure tested
and guaranteed.

Don't delay—write for our prices on
your pipe requirements today.

SUCCESS ON A TRAPNEST FOUNDATION

(Continued from Page 757.)

ing off in February and the other a
month later. "Why should we hatch
in January when we do not care to
have the pullets lay before October?"
is Mr. Gibson's point of view. Last
year he lost four per cent of the first
hatch and seven per cent of the sec-
ond, but the loss in the latter case
might easily have been avoided. It
was due, apparently, to allowing the
chicks unlimited access to sand at the
beginning. They filled their crops with
it to their undoing.

Care of Pullets

After six weeks in the brooder house
the chicks are transferred to colony
houses. These colony houses are
simple affairs, 9x12 open front, built
of 1x3 lumber and covered with tarred
paper, each holding 100 chicks at the
start, but the 100 is soon cut down to
75 or less by culling and removal of
cockerels. Seventy-five birds to a
flock is Mr. Gibson's ideal. If there
are more it is because reduction is ex-
pected.

Each colony house stands in the mid-
dle of a quarter-acre yard, which was
planted to wheat during the winter.
When the chicks are put in these
yards they find not only ample range
and standing wheat to harvest but
the shade of a splendid live oak for
hot days. So numerous are the oaks
in Happy Valley that they look like
orchard trees, only finer. Every yard
has its oak, and in the shade of these
oaks the pullets gather day after day.
There could be no more perfect shade,
and it is no wonder the pullets grow
like weeds.

Portable hovers are used in the
colony houses at first, but are soon
removed, and the chicks find their
way to the roosts from the lath lad-
ders which are their first roosting
places.

Symmetrical development is never
sacrificed to early production. The
pullets are not expected to lay before
six months. If they lay a little sooner
no harm is done, but too early laying
is decidedly detrimental. In order to
secure full maturity before laying be-
gins, as soon as the pullets begin to
sing and show reddening combs they
are put on the conditioning mash
recommended by Professor Dougherty,
which consists of 95 per cent bran and
5 per cent bone meal, and are kept on
it till growth is complete, when they
are given the laying mash again. Later
on, perhaps in November, when they
are about eight months old, the amount
of beef scrap in the mash is reduced
from 18 or 20 per cent to 8 or 10 per
cent, in order to retard laying some-
what and prevent the fall molt to
which February and March pullets are
liable.

Feeding the Layers

The mashes recommended by the
university for both growing stock and
layers are mixed on the place and
kept before the birds in hoppers. The
scratch grain mixture for layers con-
sists of 1 part each of wheat, barley
and cracked corn and 3 parts milo, all
by weight. Three-quarters of the night
ration is thrown in the litter an hour
before sunset. At sunset, when half
the hens are on the roost, the last
quarter is given. This is to make
sure that every hen has all she wants
and that a little is left for morning.
A moist mash is fed only when an
appetizer is needed—for instance,
when production begins to slacken in
late spring.

Green feed is given at 10 a. m. and
a sufficient amount is given to keep
the birds picking the rest of the day.
Alfalfa is the green used from March
to January, and barley takes its place
the rest of the year. No milk is used
except for young stock.

Labor Saving Devices

Every poultryman has his own pet
schemes for saving time and labor.
One of Mr. Gibson's is what he calls
the lazy man's way of making wet
mash. He takes a sprinkling can such
as our grandmothers watered the gar-
dens with and sprinkles the top of the
mash in the hopper.

Then there is what he calls his
feed saver. Instead of the wire so
often used on top of the mash to keep
the birds from scratching it out, he
has devised a frame made of three
strips of parting bead 3/4 of an inch

apart and tough to fit the hop-
per. This is laid on the mash and
the hens eat from between the slats.

The awnings which keep out sun
and rain, instead of being held by
props or fastened with chains, are
swung on hinges one-third of the dis-
tance from bottom to top. By this
means they may be hung at any angle
required. All roosts are swung on
wires so that they never touch the
sides of the house, and the ends of
the roosts are readily lifted to allow
every bit of wood to be painted with
insecticide.

Eggland Ranch is an excellent
example of the "one man" ranch. Mr.
Gibson keeps no help, but cares for his
1,200 hens himself, with what assist-
ance his capable young wife can give.
"We can never take a vacation to-
gether," he lamented, "for when I go
she has to look after the hens." But
1,200 hens that produce a labor income
of \$3 per hen are more profitable than
twice that number of the ordinary
kind, and the Gibsons are well satis-
fied to do without expensive hired
labor and keep the profit.

* * *

Since the above was written by
Mrs. Koethen the state poultry farm
demonstration conducted by directors
of the poultry division of the Univer-
sity of California over a period of 12
months has been completed and Mr.
Gibson's place has been given highest
score. There were 85 poultry farms
in this contest. The number of laying
hens on Mr. Gibson's place at the con-
clusion of the contest was 839 and
these 839 averaged 180.9 eggs for the
12 months. The next highest compe-
titor was given a score of 170.7.

The Santa Cruz contest has like-
wise been completed and Mr. Gibson's
pen of selected layers in that contest
averaged 197.8 eggs.

Poultry Queries

Conducted by J. A. Koethen

May Be Tuberculosis

One of my March pullets died about
ten days ago. Upon examination I
found her very light in weight, in fact,
there was hardly any flesh on the
breast bone. The liver was greatly
enlarged and full of white spots. Re-
cently I noticed a second hen standing
about as if sick and found her as
emaciated as the first. A post mortem
revealed the same enlarged liver, light
in color but without spots. What is
the trouble?—Subscriber, Paicines.

When there is marked emaciation
there is always a suspicion of tuber-
culosis. The spots on the liver of the
first hen are another symptom and
one that is considered almost conclu-
sive. The fact that the emaciation
is so noticeable in the breast is also
an indication of tuberculosis. Morse
says: "There is a combination of
symptoms that might serve to arouse
your suspicions; steadily advancing
emaciation; anemia, shown by pallor
of comb wattles and the skin about the
head; general weakness; lameness,
ruffling of the feathers and in many
cases diarrhoea. When combined with
the foregoing you notice a bright eye
and a ravenous appetite you may have
very strong suspicions." "At the post
mortem you may have your suspicions
strengthened by finding liver, spleen,
intestines and mesenteries studded
with yellowish white cheesy nodules
of various sizes." There is no cure
for tuberculosis when it has reached a
stage where it can be diagnosed. All
you can do is to bury deep or burn all
birds that die, and disinfect thor-
oughly. As emaciation is the first
symptom that can be noticed it would
be a good plan to go through the flock
and pick out all birds that are notice-
ably under weight. Put them by them-
selves, feed them liberally and watch
them. It is possible you are feeding
a ration that does not contain enough
fat and carbohydrates. If you are not
feeding it corn should certainly be
added to the scratch feed and corn
meal to the mash. As you do not men-
tion your method of feeding I can only
make this suggestion.

Lima bean growers are hard hit by
the heavy increase in freight rates,
now \$1.30 as compared with 97 cents.

Smokes Meat by Simple, Easy Metho-
That Saves 20 Pounds in Every
100—Gives Delicious Flavor

E. Ultseh, Florence, Ala., uses a
easy, better method of smoking mea-
for home use and market. He says
"For years I have been using Wright's
Smoke. I tell you it is fine. The mea-
has such a fine taste and no insects o-
any kind trouble it. I simply won't g-
back to the old way. This year
smoked eight hogs and the meat i-
fine—it sells like hot cakes."

Mr. Ultseh simply paints his mea-
with Wright's Smoke, eliminating al-
bother and loss. Wright's Ham Pickl-
is fine for sugar-curing—simply mix-
with 27 pounds of salt and pack mea-
in it. The Wright method make-
meat curing a simple matter. Thot-
sands recommend it.

Large bottles of Wright's Smoke o-
Wright's Ham Pickle cost little at an-
drug store. If your dealer hasn't ge-
unine, guaranteed Wright Food Pro-
ducts, write E. H. Wright Co., 83
Broadway, Kansas City, Mo., for free
booklet.—Adv.

NATIONAL EGG LAYING CONTEST

Mountain Grove, Missouri, final report.

S. C. Rhode Island Reds win the high honors, both in hen and pen. Pen owned by W. A. Magruder, Eolia, Missouri, won the cup for October with a record of 97 eggs, also the large cup and \$50 for the high pen over all breeds, with a record of 1,233 eggs for the year, or an average of 246.6 eggs per hen.

Hen owned by R. M. Ellis, Tipton, Missouri, won prize for high hen over all breeds by laying 296 eggs during the year, \$5. The 300 hens in the Ninth National Egg Laying Contest, which closed October 31, 1920, laid 56,311 eggs during the 12 months of the contest, making an average of 187.7 eggs per hen. This is an increase of 3.7 eggs per hen over the average of the eighth contest. There were 120 hens laying 200 or more eggs during the year, a gain of eight hens over 112 last year. Since the first contest held nine years ago the average egg production has increased yearly with the exception of one year. Several of the breeders who had birds entered in the first contest have had a pen entered each year.

Practically all breeds made an excellent record for the year and it is an evident fact that with proper care and a well balanced ration most all breeds of poultry can be kept at a profit. The feed ration used in the contest was as follows: Grain; 50 pounds cracked corn, 50 pounds wheat. Mash; 25 pounds bran, 25 pounds shorts, 30 pounds corn meal, 10 pounds ground oats, 12 pounds beef scraps, 1½ pounds fine salt. A moistened mash was fed each morning throughout the year, and the principal grain feed was in the evening, early enough for the birds to consume all they wanted before dark.

The average feed consumed per hen for the year was 33.48 pounds mash and 51.26 pounds grain. The average cost of mash per 100 pounds for the year was \$3.69; the average cost of grain was \$3.61. The total feed consumed per hen for the year was 84.74 pounds, at an average cost of \$3.09 per hen. The average cost of straw for litter per hen was .08, two pounds oyster shell was .03, egg cases for shipping eggs was .38, or a total expense of \$3.58 per hen. The average egg production for the year was 187.7 eggs per hen, the average price received was approximately .46 per dozen. The net sale of eggs for the year was \$7.17 per hen, leaving a net profit of \$3.59 per hen above the cost of production. These eggs were sold on an open market to commission merchants; none were sold for breeding purposes. All feeds were bought on a local retail market, with the exception of the beef scraps and oyster shell.

Ten highest pens for the year: S. C. Reds, Missouri, 1,233 eggs; White Wyandottes, Missouri, 1,171; Barred Rocks, New York, 1,168; S. C. Reds, Missouri, 1,140; R. I. Whites, Missouri, 1,140; S. C. White Leghorns, New Jersey, 1,133; S. C. White Leghorns, England, 1,132; S. C. Reds, Alabama, 1,129; Barred Rocks, Canada, 1,119; Columbian Rocks, Missouri, 1,117.

Winning pen in each class: S. C. Reds, Missouri, 1,233 eggs; White Wyandottes, Missouri, 1,171; Barred Rocks, New York, 1,168; R. I. Whites, Missouri, 1,140; S. C. White Leghorns, New Jersey, 1,133; Anconas, Missouri, 1,057.

Winning individual of each class: S. C. Red, Missouri, 296 eggs; R. I. White, Missouri, 271; White Wyandotte, Arkansas, 270; White Rock, Idaho, 264, tie; Ancona, Missouri, 264, tie; S. C. White Leghorn, England, 262.

AMERICAN EGG LAYING CONTEST

Leavenworth, Kansas. Report for October, 1920.

Ten Highest Pens for 12 Months

R. C. R. I. Whites, Kentucky, 1,218 eggs; S. C. W. Leghorns, Pennsylvania, 1,197; S. C. W. Leghorns, Texas, 1,144; S. C. Reds, New York, 1,135; S. C. White Leghorns, Iowa, 1,128; White Wyandottes, Pennsylvania, 1,103; S. C. White Leghorns, Washington, 1,072; S. C. White Leghorns, England, 1,071; S. C. R. I. Reds, Illinois,

1,053; S. C. White Leghorn, Michigan, 1,043.

Ten Highest Pens for October

R. C. R. I. Whites, Kentucky, 74 eggs; S. C. R. I. Reds, New York, 63; White Wyandottes, Canada, 56; S. C. R. I. Reds, Illinois, 52; White Wyandottes, Pennsylvania, 47; White Wyandottes, Illinois, 47; White Wyandottes, Canada, 45; S. C. Reds, Missouri, 43; S. C. White Leghorns, Illinois, 42; S. C. White Leghorns, Pennsylvania, 38.

Record of Leader to Date

White Wyandottes, 253 eggs; Partridge Wyandottes, 197; S. C. R. I. Reds, 246; White Orpingtons, 216; White Rocks, 187; Barred Rocks, 230; R. C. R. I. Whites, 285; S. C. Anconas, 185; Brown Leghorns, 189; White Leghorns, 272.

STAND BY THE ORGANIZATION

Every-cooperative marketing or other cooperative association has its tersting time. None ever yet started without mistakes being made and no community ever endeavored to start one but there were more or less selfish people to be considered. It is very attractive to these people to have others hold the sack while the "independents" have all the advantage of the cooperative movement. The testing time now seems to be before the Poultry Producers of Central California. A writer in the Petaluma Poultry Journal, Chas. Blom, addresses an open letter to the poultry people of Sonoma County. He addresses it to the women because: "during the past 30 years I have noticed that the greatest burdens on a poultry ranch generally rest on the shoulders of the poultryman's wife. To date I have never seen a successful poultry plant that did not owe its prosperity to a woman."

Then in regard to the necessity for maintaining the present cooperative movement Mr. Blom says:

"The unorganized farmer today is what he always has been, a slave or servant to the middleman. We see this pretty thoroughly illustrated in the dairy, cattle, hog and sheep business today. Look up San Francisco prices. Thin cows from three cents up.

"Should the Poultry Producers be so unfortunate as to go under, grass would soon be growing on the main streets of Petaluma. We cannot go back to old marketing methods. Markets farther and farther away have to be discovered, and this takes money. The orange, raisin and prune associations are spending millions of dollars yearly in advertising alone. The first purse raised by the raisin men for advertising purposes when they were in the swaddling clothes stage of the game was \$100,000.

"Let these poultrymen that want to go back to old times come out in the open and give their reasons. Let them tell us why they are quitting and what they expect to gain by so doing. One not acquainted with the quitter would naturally think the paper would be flooded with answers to my letter. I'll prophesy that there will not be one line in answer to my letter. I know the type. I've lived among them for a life time. Their religion is misery, tear down, but never build up."

THE PROLIFIC CHICKEN LOUSE

The rapidity with which chicken lice multiply is marvelous. For instance, so prolific is one pair of lice that in less than two months time they are the ancestors of over 100,000 descendants.

The greater part of the life of the louse is spent on the body of the fowl. The barbs of the downy feathers are the favorite places of abode for the eggs or nits.

Since dipping of lousy fowls has been found impractical, due to resulting colds and disease, dusting has been resorted to with excellent results. For this purpose home made powders are very efficient and a most effective one is made by mixing one

part of stock dip or crude carbolic acid with three parts of gasoline, to which is added as much cement or plaster of Paris as it will take up. When the final mixture has become dry and powdery apply a liberal dust-

ing to the fowl. To apply it most effectively hold the fowl up by the legs so that the feathers will be well separated and the powder, when applied, will more readily reach the favorite locations of the lice.

Corn: Bulk, Yellow, 2.06@2.20.
Barley: 1.72½.
Kafir: Kansas, 30.00.
Kafir: Eastern, 1.66½.

HAY

Alfalfa Growers of California, report under date of December 7:

The market showed but little change during the week in most parts of the state. Somewhat stiffer prices were paid for fancy grades, the supply of which is quite insufficient while in the local Los Angeles market sales of track lots of medium and ordinary grades were made at some concessions in price, owing to temporary large arrivals. Buying is still practically altogether of the "from hand to mouth" order, more so even than before, in sympathy with the pronounced tendency in all lines of business of reducing stocks on hand to a minimum. The seemingly endless decline in prices, of grain, cotton, etc. which has been one of the principal causes of the present all around congestion and depression the country over, has for the first time been relieved last week by a sharp reaction from the previous lowest price levels, which is an encouraging sign, as it revives the hopes for a change for the better; this will probably not be far off after the proper measures planned by congress and the reserve bank for financial aid in the marketing of crops, have been put into effect. In the meantime there is a good deal of talk in all parts of the state about many growers of wheat, barley, corn, cotton, rice, sugar beets, etc. all planning to put their acreage into alfalfa, as this is about the only general farm product the price of which has not gone all to pieces.

There were 1,400 tons received on the tracks in Los Angeles the week ending December 4, with 125 tons left over as against 1,000 tons the week before.

Book Review

HOME AND FARM FOOD PRESERVATION

"Home and Farm Food Preservation," by Wm. V. Cruess, assistant professor of food technology, University of California, published by Macmillan Company, New York, \$2.00. This is a book which should be in

of the raisin crop in California is over \$10,000,000 annually. The other dried fruit industries are smaller but their aggregate value amounts to many millions of dollars yearly in the United States. From this, the importance of commercial food preservation may be seen.

There are 35 chapters and many half-tones and line drawings. The chapters treat of why food spoils; ways of preventing spoiling; methods of food preservation; canning of fruits, vegetables, meats; fruit juices; syrups; jellies and marmalades; jams, butters, and pastes; candied fruits; fruit drying; vegetable drying. After discussion of the general proposition of saving the wastes of fruits in various forms, then other chapters give specific directions as to every step in practically every kind of food preservation. Even milk and its products are thoroughly discussed. Sterilization and pasteurization of milk, the storage of butter, making of cottage, cheddar and other types of cheese, are all touched upon, and in cases where more extended details are needed other books or bulletins are referred to. The 35 chapters of the book make up three parts. The first touches upon theory of food preservation, the second upon methods, and the third upon specific recipes. In addition there is an appendix with tables with formulas

was the one representing the deciduous fruit industry. This group met at the office of the dean of the college of agriculture at Berkeley on Monday, November 22. The past work of these departments and their plans for the future were thoroughly reviewed and the funds necessary to carry on the work discussed. Arrangements for this meeting were made by R. N. Wilson, secretary of the committee. On the following day the committee met at the office of Director Hecke at Sacramento and reviewed the work and plans of the office of pest control, viticulture, standardization, crop statistics and quarantine service as divisions of the state department of agriculture. The committee also made a trip to the university farm and secured information relative to its needs.

Representatives selected by the various groups met on Wednesday, December 1, to formulate budget figures and present the claims of agriculture to the state board of control and to Governor Stevens for the purpose of securing sufficient funds for the next biennium to permit the work of these departments to progress as it should. —F. K. H.

POISONING BOLL WEEVIL

The Alabama experiment station has

of \$19.51 per acre. Experiments carried out in Texas show equally good results.

WAGE SCALE IN RICE FIELDS

The Glenn County Rice Growers Association at a recent meeting at Willows canvassed the serious situation of the rice growers and decided to lower the schedule of wages paid in the harvesting operations. The following scale was adopted:

Horse with harness, \$1 per day; binder drivers, \$5.50; shockers, \$4; team, man and wagon, \$7; four horses, man and wagon, \$9; bundle wagon drivers, spike pitchers, bundle pitchers, \$4; sack sewers, \$7; separator tenders, \$9.50; sack bucks, \$5.50; jiggers, \$7; stationary engineers, \$5.50; trucking, 20c to 30c ton mile, according to condition of roads; threshing, 25c to 40c hundred; tractors, 75 h. p., \$5 an hour; threshing machines, 36 inch, \$35 per day; wagons, 50c a day, with bundle racks, 75c a day; binders, \$7.50 to \$10 a day, with auxiliary engine, \$15. Board is charged at \$1.50 per day.

BAHIA GRASS

Bahia grass (*Paspalum notatum*), recently introduced into Florida, has been shown in tests at the station to possess ability to spread and make a good sod while being subjected to heavy pasturing. This grass is said to be indigenous to South America and northward to Mexico, and to have been introduced into this country by the U. S. department of agriculture in 1913.

STEADY GROWTH

The new home of The A. H. Averhill Machinery Co., California distributors of the Russell machinery with factories at Massillon, Ohio, is drawing to completion at San Jose. The warehouse proper, a building 100x150, consists of a substantial frame covered with heavy galvanized sheet iron. To this will be added a roomy office and well equipped shop. The A. H. Averhill Machinery Co. has been selling the Russell line of gas and steam tractors, threshers and saw mill machinery on the Pacific Coast since 1882. A larger and better equipped plant has become a necessity because of the increasing demand for Russell goods. The California house has been located at San Jose for the last 25 years. The thousands of various Russell machines now in use in the state testify to the steady growth of this company.

the hands of every fruit grower of California who may have any fruit wastes which may be saved by drying, canning or preserving or even making into syrups, vinegar, etc., or anyone who may have occasion to preserve meats. The author says in his preface: "Since early historical times food preservation has been second only in importance to food production. Grapes and other fruits were dried by the ancients to preserve them; fruit juices were fermented to make wines and vinegars; cereals and vegetables were stored to protect them against moisture and decay; olives were preserved by salting; and meats were salted, dried and smoked. The use of sugar and vinegar in preserving fruits and vegetables came later. The preservation of foods by sterilization in sealed containers is a development of the nineteenth century and dates from its discovery by Nicholas Appert in France about 1800. Cold storage, as a means of preserving all perishable products, has, during the past century, developed into a very great industry. "Three billion cans of food, valued retail at \$600,000,000, were sold in the United States in 1916. The meat packing and cold storage industries compare favorably with the canning industries in size. The wholesale value

for soldering fluid, federal standards for vinegar, together with vast number of references to books or bulletins on home canning and other subjects.

STATE AID FOR AGRICULTURE

The agricultural legislative committee is in action. This committee, which came into being as the result of much discussion at the Chico fruit growers convention, is the first organized attempt by farmers and fruit growers of California to secure their just proportion of consideration at the hands of lawmakers and officials of the state.

For the purpose of investigating the needs of the college of agriculture at Berkeley, the university farm at Davis, and the state department of agriculture at Sacramento, the committee was divided into groups representing the various agricultural interests as follows; poultry, animal husbandry, dairy, agronomy, and deciduous fruit. During the last half of November the groups have met and gone into the work and plans of the divisions of the college and the agricultural department in which they were most vitally interested.

Perhaps the largest of these groups

published a report of control work with the boll weevil by dusting cotton with calcium arsenate, conducted by the station entomologist in 1919.

In nine plats in four localities in which power dusting work was completed, results which seemed to be reliable were obtained on 120.78 acres. The average yield per acre of seed cotton on this area was 903.5 pounds, representing a gain over the yield on the check areas of 247.5 pounds per acre, or an increase of 38 per cent. The total cost for treatment for the entire area was \$1,130.63, or an average of \$9.36 per acre for this part of the entire dusted area. The total net profit for the entire area amounted to \$2,775.79, which is an average of \$22.82 per acre net profit from the dusting work with power machines.

In three hand dusted plats with a total of 4.7 acres, from which complete records were obtained, there was an average yield of 668 pounds per acre, or an increase of 22.3 pounds per acre over the yield of check plats. The total gain from the dusting on the 4.7 acres was 1,044.75 pounds, worth \$135.82. The total cost for treating the 4.7 acres was \$44.13, leaving a total net profit for that area amounting to \$91.69. This is an average net profit

HELP THE TIRED WORKER

A Request In the Spirit of Christmas

Christmas shopping has begun!

In addition to many passengers, we must, until December 25th, carry many packages and bundles,

Each day from 6 to 9 A. M., and from 4:30 to 6:30 P. M., every car this railway has (except those undergoing repairs) is in service moving the workers to and from their work, and at BEST some must stand for a part of their journey.

During the Christmas period, will you not contribute to the comfort of many tired workers by planning your journey to and from the city between 9 A. M. and 4:30 P. M.?

Will you help us to serve BEST those who NEED service most?

Pacific Electric Railway

Where there is Secrecy and Evasion there is Something to Hide

SMALL wonder that the tire-buyer's mind has been disturbed in the past few months. Suppose a man came up to you and offered to sell you a tire.

You would want to know something about it before you bought—where it came from—who made it—what it might be expected to do—and what the man who is selling it to you expects to get out of it.

* * *

Now reverse the situation. Go into a tire store.

You will never learn anything about the tires you

find there from the *prices*.

The size of the discount will never tell you anything about the *actual value* of the tires.

There is *only one* way of telling anything about the tires you find in a tire store—by their *reputation*—the standing and responsibility of the company behind them.

If a dealer has the *right kind* of tires in his store they will be known. They will have a reputable name on them. The buyer will be given *facts* about the tires.

* * *

The facts about United States Tires are easily obtainable.

Thousands of dealers all over the country stand ready to give them to you.

Dealers who are more interested in securing the *confidence and good will* of the motoring public than they are in merely selling a number of tires.

The United States Rubber Company stands behind these dealers with all the strength and influence at its command.

Backing their responsibility with its own. *Staking all of its great and wide and varied resources on the quality of its tires and of its dealers.*

* * *

United States Tires are *always* worth what you pay for them.

And the dealer who sells them to you is worth just that much more as a straightforward tire merchant.

A Christmas Carol

James Russell Lowell

"What means this glory round our feet,"
The Magi mused, "more bright than
morn?"

And voices chanted clear and sweet,
"Today the Prince of Peace is born!"

"What means that star," the shepherds
said,
"That brightens through the rocky
glen?"

And angels, answering overheard,
Sang, "Peace on earth, good will to
men!"

'Tis eighteen hundred years and more
Since those sweet oracles were dumb;
We wait for Him, like them of yore;
Alas, He seems so slow to come!

But it was said, in words of gold
Nor time nor sorrow e'er shall dim,
That little children might be bold
In perfect trust to come to Him.

All round about our feet shall shine
A light like that the wise men saw,
If we our loving wills incline
To that sweet life which is the law.

So shall we learn to understand
The simple faith of shepherds then,
And, clasping kindly hand in hand,
Sing, "Peace on earth, good will to
men!"

And they who do their souls no wrong,
But keep at eve the faith of morn,
Shall daily hear the angel song
"Today the Prince of Peace is born!"

Section of the Coco Ranch apricot orchard showing remarkable growth of trees which were planted in March, 1920. Assistant Superintendent Frew (with cap) in the foreground.

These lima beans on the Coco property produced, under proper irrigation, 1,300 pounds to the acre. President Teague (in straw hat) in the foreground, Manager Thorpe at his right, Superintendent Goodspeed in the background.

You Can Make BIG Money on CHEAP Land

The time has passed when men will grow rich on high priced orchard land. Interest on the investment and high taxes will eat up most, if not all, of the profits.

It is just as unwise to buy POOR land, simply because it is cheap.

Occasionally a tract of fine quality can be obtained at a reasonable figure. Such a tract is the 1,900 acre orchard property of the California Orchard Company, located on the State Highway between Los Angeles and San Francisco, in the famous Salinas Valley.

This tract, carefully selected by soil and horticultural experts, and probably the largest and finest undeveloped orchard proposition under irrigation in California, was purchased by the Company at the remarkably low price of \$126.50 per acre.

The deal was made direct with the former owners. No agent's commission was paid. Every dollar paid for stock by stockholders has gone into the treasury of the Company—no commission to anyone.

Development Already Well Advanced

The Officers, Directors, and principal Stockholders of the Company are all men of long and successful experience in California farming and horticulture, which alone assures complete success of the enterprise.

The Company took possession of the property January 1, 1920. Since then development has been phenomenal.

Headquarters buildings, boarding house, bungalows for family men, have been built.

Four 16 inch wells have been drilled, each producing over 250 inches of water, (a total of over 9,000 gallons per minute); 116,000 feet (22½ miles) of concrete irrigation pipe lines have been installed, and 16,000 feet of 20 inch and 16 inch steel pipe line laid.

Over 400 acres of trees are now planted to orchard, and 500 acres additional will be planted the coming spring. A nursery with over 125,000 trees was set out, from which will be selected the trees for completing the entire plantings fifteen months hence.

Until the trees reach bearing age, lima beans, peas, and vegetables will be profitably intercropped.

Eight varieties of trees are being planted about as follows:

Apricots	250 acres	Peaches	250 acres
Almonds	250 acres	Prunes	250 acres
Walnuts	250 acres	Pears	250 acres
Apples	250 acres	Plums	100 acres

All of these varieties have proven successful in the neighborhood.

By producing a wide variety of crops, some to pack and sell fresh, some dried, others to canneries, thereby averaging good markets with occasional bad ones, heavy crops with light ones, this investment is bound to prove safer than when staking all on one variety of product.

It is possible only with a LARGE PROPERTY of this kind to obtain the services of horticultural specialists. The Company's present Superintendent is Mr. W. E. Goodspeed, an agricultural college graduate, later instructor, and, prior to joining the army, Manager of Field Department of the California Walnut Growers Association.

Mr. Goodspeed has gathered around him an excellent staff of young and energetic workers, all

specialists in their particular lines, all of which insures the most economical and efficient development of the property.

The California State Commissioner of Corporations granted the Company privilege to sell 5,940 shares of stock AT PAR \$100 per share. This was all sold within the past year, except 268 shares, which according to permit cannot be offered ABOVE par.

The Company now offers this remaining allotment therefore AT PAR and feels that the funds thus raised will be ample to finance its operations till its orchards come into bearing.

However, if it is later found advisable to offer additional treasury stock, the price will surely be greatly advanced, as the intrinsic value is already between \$150 and \$200 a share.

To those having funds available we strongly recommend California Orchard Company stock as a safe, and ultimately most highly profitable investment. You may buy as little as one share.

This offering will be grabbed up quickly. Suggest you write today for prospectus, terms of sale, and any other desired information.

This pear tree on Salinas Land Company ranch one-quarter mile from Coco property shows the prolific crop of excellent fruit which trees in this locality produce. It was difficult under the light conditions when this photograph was taken to bring out the tremendously heavy crop of pears on this tree. It was simply loaded with beautiful fruit.

Seven year old apricot orchard located four miles north of Coco property. The 1920 crop of this orchard sold for \$435 per acre. With sufficient water available, as is the case with our own land, production would have been more than twice as heavy—evidence of what can be reasonably expected under our favorable conditions.

One Dollar Yearly

Back to Normalcy With Livestock

By R. P. Royce

THAT the agricultural industry of the nation is passing through a critical period of readjustment there can be no doubt. In nearly every commodity there has been a drastic lowering of values, and in most cases the drop has been altogether too severe to be justified by conditions. If the last statement is true, and the writer believes that the majority of producers will agree, it is safe to predict that before long values will show considerable strength above present ranges for the reason that natural de-

mand is bound to put values where they rightfully belong. Generally speaking, we can be equally certain that we will not see a rebound to levels maintained during the war years. There is a definite and apparently inexorable demand for lower living costs and we who are interested in agriculture might just as well make up our minds to that truth now as later and plan to get our operations on a sound basis. The present is no time to jolly ourselves into be-

lieving that values will speedily get back to the peak points from which they have fallen or to throw up our hands with the feeling that the bottom has dropped out of everything. We are simply getting back to earth and while doubtless many producers are going to be pretty hard squeezed, in the main we will all pull through.

The future prosperity of agriculture will depend to a large extent on how we as individuals meet the present situation.

In any scheme of readjustment we will do well to remember that while organized effort can be made to accomplish much, such accomplishment will be in direct proportion to the individual efforts and intelligence of the cooperators.

So far as livestock production is concerned it is admitted that values have reached an unwarranted level, but in that respect livestock is no different from practically all other agricultural products. Furthermore, we can be fairly certain that livestock values will

(Continued on Page 806.)

Get Busy Quick With Peach Blight

FOR a score of years peach growers have been fighting peach blight, and in some sections, especially in the interior valley, find it necessary to persist in the fight. The best period of the year to accomplish the destruction of the pest, or at least to control it, is in the fall or early winter as soon as the leaves drop and make possible clean work. All peach orchards should be sprayed prior to January 1 with a good fungicide, preferably Bordeaux, though some feel that lime-sulphur 1-10 is equal in its beneficial effects and, in addition, rids the trees of San Jose scale. In a bulletin on the subject Prof. Smith remarked: "September is too early and February and March too late; December gives best results."

Here enters another disease which also complicates the situation. This is peach leaf curl. The same spray which succeeds with the blight also succeeds with the leaf curl but, unfortunately, the blight has to be sprayed very late while peach leaf curl is best controlled by very early spring spraying. Hence it appears to be almost necessary to give two sprayings.

Presumably nearly all of the peach growers are today using the commercial mixture of lime-sulphur wash, but for those who may prefer, here is the formula for the home made lime-sulphur solution: Stone lime, 50 pounds; sulphur (sublimed or powdered), 100 pounds; water to make 50 gallons.

Heat in a cooking barrel or vessel about one-third of the total volume of water required. When the water is hot add all the lime and at once add all the sulphur, which should previously have been made into a thick paste with water. After the lime is slaked another third of the water should be added, preferably hot, and the cooking should be continued until a clear orange colored solution is obtained (usually 45 to 60 minutes), when the remainder of the water should be added, either hot or cold, as is most convenient. The boiling due to the slaking of the lime thoroughly mixes the ingredients at the start, but subsequent stirring is necessary if the wash is cooked by direct heat in a kettle. After the wash has

been prepared it must be allowed to settle and then be strained through a fine sieve as it is being run into the tank. The resultant product is a concentrated solution of lime-sulphur, which should be diluted about six times with water for a winter spray.

In case the commercial lime-sulphur is used, either nine or ten parts of water to one of the lime-sulphur is effective, not only effective, but we believe rather more economical, especially in view of the fact that a mistake in cooking or preparation of the home made mixture lessens its effectiveness. After this spraying, which should be done at once, trees may be allowed to rest until the buds begin to swell in the spring, when a thorough spraying with Bordeaux mixture will have some advantage in control of the blight and more of value in leaf curl control. We have asked County Horticultural Commissioner Ryan to give us the latest in curl leaf. Mr. Ryan says:

Leaf Curl of the Peach

Peach leaf curl, or "curly leaf" of the peach, as it is often called, is one of the most common and easily identified diseases of the peach. The leaves as they develop in the spring will curl and become distorted and take on an unnatural color which sometimes develops into a bright pink or red.

There seems to be no way of determining in advance whether the disease will appear or not. Some varieties of peach seem to be more susceptible than others, and individual trees in the same orchard will show a difference in the amount of injury. Cold, damp weather in the spring is most favorable for the development of leaf curl.

Sometimes a swelling of the affected shoots will occur, but the characteristic injury to the leaves is unmistakable. A considerable loss of young fruit often occurs, and as the deformed leaves die and drop from the tree a loss of older fruit is often caused when the injury is extensive even though a new crop of leaves is later developed.

The disease can be almost entirely prevented by spraying thoroughly so as to cover all parts of the twigs and buds just before the buds open in the

spring, using commercial lime-sulphur, 1-10, or Bordeaux mixture, 5-5-50 formula.

Spraying is of little value after the leaf buds have opened and the fungus has had a chance to enter.

TWIG BLIGHT OF PEACH AND APRICOT TREES

By T. D. Urbahns

The severe blighting of peach, apricot and plum trees in many localities during the spring of 1920 and causing a loss totaling many thousands of dollars to California fruits, was without doubt mostly caused by the disease known as brown rot (*Sclerotinia fructigena*).

The spores from which this disease develops multiply upon the mummified fruit and infested twigs, on the trees or on the ground. These spores being so light that they are readily carried in the atmosphere, drift freely about with the wind. Atmospheric humidity and the absence of sunlight appear to be favorable to the development of this disease. Its first appearance may be noticed on the blossoms. Many of them are killed and the disease then works down the fruit spurs to the twigs. The fruit and leaves of the affected twigs wilt in a few days. Frequently the disease enters a fruit spur two or three feet from the end of a branch, killing the cambium layer and sometimes girdling the smaller branches which in turn wilt and dry. The fruit fails to set, twigs die back and gumming of the branches follows.

A week or more of bright sunlight and dry atmosphere retards the spread of this disease, but poor air drainage, spring showers and fogs result in its continued spread. Fortunately, our summer climate, being one of low atmospheric humidity in most of our interior valleys, is unfavorable to the further development of this much dreaded disease. Otherwise we might expect even greater losses by its becoming active upon ripening fruit and fruit en route to marketing points.

The best authorities on plant diseases still differ somewhat in their opinions as to the complete control of this fungus disease. It is however apparent that certain definite practices in orchard sanitation are of value in checking its ravages and that spraying practices are necessary for its

practical control. Even with the best of methods this fungus disease is difficult to control under unfavorable weather conditions.

Control methods should unquestionably begin in the fall or even in the summer. The infected branches should be carefully pruned away and burned. All decayed fruit should likewise be destroyed and every precaution taken to remove the mummified fruit remaining on the trees during the winter. This should either be burned or thoroughly covered by plowing.

With the best possible clean-up in an orchard it would be practically impossible to remove all sources from which the brown rot spores originate. It then becomes necessary to destroy such spores as may adhere to the bark or bud scales, by the application of an effective fungicide. This may necessitate one, two, or more sprayings, depending upon the effectiveness of the materials used and the thoroughness with which the work is done. Either the Bordeaux mixture (6-6-50) or the lime-sulphur, winter strength, should destroy all spores actually saturated with the fungicide in early spring before the breaking of the buds. Fall spraying is unquestionably of value but should not be completely relied upon because many additional spores of the brown rot disease may again become lodged on the bud scales between the time of fall spraying and the blossoming period.

The value of spraying after the blossoming period is unquestionably reduced because it is practically impossible to reach the diseased tissue within the fruit spurs and twigs by the external application of a fungicide. A lime-sulphur spray (1-15) at the time the blossoms are opening and another application (1-25) after blossoming, is sometimes recommended. Additional sprayings with wettable sulphurs are also sometimes applied to protect the growing fruit.

The writer understands that detail experiments are being conducted by Dr. Howard of the University of California to determine the comparative value of the different spray applications. Let us hope that through this source we may soon have additional light that will aid us in the protection of trees and fruit from the brown rot disease.

Agricultural News Notes of the Pacific Coast

Northern California

Sacramento County starts a farm bureau drive this month.

Williams, Colusa County, will have a community Christmas tree.

Magalla, Butte County, records for the season over 30 inches rain.

A new farm center has been organized at Trenford, Yolo County.

Orland, Glenn County, expects to ship out between 500 and 600 boxes of oranges.

The winter vegetable crop is moving from the Sutter Basin. Grain seeding has begun.

Large shipments of celery are now going out from Antioch and Walnut Grove sections.

Land owners of Colusa County have expended more than \$2,000 in rodent control since March, 1919.

Hundreds of rice field workers have lost their jobs and left for cities because of recent storm damage.

The annual meeting of the Alameda County farm bureau was held at Hayward on Saturday, December 11.

Sutter County farmers are indignant over many purchases of land by Japanese just before going into effect of anti-alien law.

The Arbuckle chamber of commerce is already laying plans for a bigger and better Arbuckle Almond Show and Colusa County Fair.

Vegetable and produce growers of the state are being organized into a cooperative marketing association by the state market commission.

California is among the first states in the production of onions with a record of 2,000 carloads out of the state and a record of 300,000 sacks raised annually.

Humboldt County has a newly organized milk goat association. The association has purchased necessary machinery and negotiated for a cheese maker from Switzerland.

Glenn County farm bureau meetings: Codora, December 13; Capay, 15; Plaza, 17; board of directors, 1 p. m., 18; Willows, 20; Larkin, 21; Grapevine, 22; Elk Creek, 27.

The Chico-Orland state highway section hopes to have bridge built over the Feather River at a total cost of about \$130,000, the bridge to be completed before the end of 1921.

Fig growers of the Oroville section held a meeting the last day of November and were addressed by I. J. Condit who is now connected with the California Peach and Fig Association.

George Compere, deputy quarantine officer at San Francisco, took a 20 foot tumble from the ladder at the side of an incoming steamer to the deck of a tender below and was quite seriously injured.

As a part of the work of the fruit growers short course given at the university farm at Davis attendants made tour of the orchards of the Delta district viewing demonstrations in pruning and other cultural operations.

The Pacific Rice Growers Association has fixed upon \$2.60 f. o. b. to growers. Clean rice prices are named as follows: Fancy head, \$5.25; choice head, \$5.00; fancy screenings, \$3.40; choice screenings, \$3.15; brewers, \$2.85. On this basis fancy No. 1 paddy should net the grower \$2.60 to \$2.70 at shipping point.

Central California

Monterey reports a great number of whales offshore.

Santa Cruz poultry producers are uniting in marketing eggs.

Hanford, Kings County, is holding a poultry show this week.

The highway between Watsonville and Santa Cruz is now paved.

Birds reduced the toyon berries so that the crop this year was small.

The Lion ranch at Gilroy is being subdivided into 10 to 40 acre tracts.

Santa Cruz County is making a campaign on coyotes and other predators.

Livingston, Merced County, is talking of development of a rice growing section.

Owens Valley maintains that it will be one of California's finest pear producing sections.

Tracts which have grown cereals for years are giving way to orchards and vineyards near Clovis.

A grain growers club has been organized from the membership of Stanislaus County farm bureau.

Inyo County's Pear Producers Association was recently organized at Bishop. W. Waterson is president.

The Tulare County farm bureau has been holding a series of vine pruning demonstrations conducted by A. E. Way of the Kearney Vineyard.

A bond issue of \$2,000,000 has been proposed for the acquisition by the Fresno irrigation district of the Fresno Land and Canal Company.

Lindsay district, Tulare County, reports its 18 packing houses operating at full capacity. One hundred carloads per day are being shipped out.

The Tulare County farm bureau has decided to establish a purchasing and a selling division through which members may buy at wholesale prices farm implements and other supplies.

Kern County farm bureau meetings: Mountain View, 20; Pond, 22; Inyo-Kern, 23; Rosedale, 24; Shafter, 29; Arvin, 31.

Rice growers of the Oakdale districts have been seriously handicapped in harvesting operations by heavy rains, but they report yield from land already harvested much better than anticipated.

Farm bureau representatives recently appeared before the state railroad commission and representatives of the California Edison Company at Visalia and made appeal for consideration of farmers rights in revision of rates.

J. F. Niswander, vice president and general manager of the peach growers, estimates that the 1920 fig crop will amount to 9,000 tons. The crop is being assembled in the warehouses of the Peach and Fig Growers Association. There is very little sale of figs at the present time.

At a meeting of sheep growers at Stockton, November 29, the following resolutions were passed and sent to California representatives in Congress: "The Central California Wool Growers Association in session at Stockton, California, strenuously urges your immediate action looking to federal aid for the protection of our industry and from total loss due to competition with foreign wools and frozen meats."

Southern California

The Garden Grove Walnut Growers Association is operating a cracking plant.

The Highgrove Fruit Exchange claims the honor of sending out the first Navel oranges from the Riverside district.

Cantaloupe growers of Imperial Valley are discussing acreage for next year's planting. Contracts are not yet being made.

Garden Grove Walnut Growers Association has closed its first pool. Twenty-five carloads have already been sent out.

The Japanese farmers association estimates that 8,500 acres will be planted to lettuce in the Imperial Valley this winter.

Imperial Valley cotton growers have been saved \$153,000 because of association's management of the harvest labor campaign.

Sugar beet growers of the southern end of the state met at Santa Ana last Saturday and took steps to form a cooperative association of growers.

The Anaheim Citrus Fruit Association netted to members for last year's fruit \$798,605.25, about \$2.38 per loose box as delivered from the groves.

Manager Churchill of the California Lima Bean Growers Association reports a heavy carryover of small white beans in this state and in Michigan.

Imperial Valley is joining in the campaign to secure reconsideration of the recent increase in freight rates which will prove almost prohibitive.

Better quarters for girls employed in packing houses is being urged by the citrus growers of the San Dimas-La Verne district of Los Angeles County.

Los Angeles County farm bureau held an all day outdoor session on the Santa Anita Ranch last Saturday. The occasion was the regular annual meeting.

Navel oranges have colored nicely and liberal shipments have been made from the southern end of the state. The real shipping season will not open until early January.

The Alfalfa Growers Association will follow a new system of marketing alfalfa, working through representatives of farm bureaus and local representatives in various purchasing centers.

The southern end of the state was visited by a light rain which was considered the tail end of the recent severe storms of the North. A few sections received but little more than one-tenth of an inch.

After January 12 there will be a quarantine in force against grape cuttings from north of the Tehachapi being brought into Southern California. This is intended to prevent spread of phylloxera.

The California Fruit Growers Exchange, through its industrial relations department, states that unless some definite effort is made the supply of Mexican labor in Southern California will all have returned to Mexico.

Stage lines operating between San Diego and Imperial Valley, Los Angeles and San Diego and Los Angeles and Santa Barbara have received authorization from the state railroad commission to raise their rates approximately 15 per cent.

The Coast and General

Isle of Pines is now shipping grapefruit to New York.

The national congress convened on December 6. Great crowds were in attendance.

A drainage district is to be created along Beaver Creek, Oregon, to drain 2,000 acres.

Many Lane County, Oregon, dairymen purchased stock at the Pacific International.

Italy reports an excellent crop of nuts this year, almonds and walnuts especially good.

Dairymen of Dubois, Pennsylvania, have established a successful milk distributing system.

The Oregon Growers Cooperative Association recently shipped a carload of prunes to Holland.

The Northwestern Fruit and Potato Growers Conference will be held at Spokane, Washington, December 13-17.

Washington apple shippers are not sending much fruit to Eastern markets because of excessive freight rates.

The United States department of agriculture will use the wireless telegraph in its market news reporting service.

The Central Oregon Potato Growers Association will ship seven cars of seed potatoes to the Yakima Valley of Washington.

Dairymen of Oregon have formed the Oregon Dairymen's League to handle marketing and generally to build up the business of members.

The Western Winter Poultry Show will be held at Portland, Oregon, December 13-18. W. S. Russell of Oakland will be one of the judges.

One thousand acres of new land on the Yakima Indian reservation, Washington, will soon be thrown open to lease. This land is under irrigation.

The Alabama legislature has recently passed a law requiring that all oriental peanuts, peanut products and vegetable oils be branded "Oriental."

The second annual convention of the American Farm Bureau Federation at Indianapolis was attended by agriculturists of note from all over the nation.

Florida citrus growers say they are up against a ventilator car shortage which is the worst ever known. Many of the cars offered are said to be absolutely unfit for use.

There has been considerable interest in Oregon in flax raising and growers have been investigating the cost of flax pulling machines. The conclusion is that hand pulling is at present much cheaper.

At the National Beverage Exposition held in Cincinnati early in November more than 10,000 sampled the grape juice sent by the California Grape Growers Exchange, the entire supply being quickly exhausted.

The joint annual meeting of the Washington State Horticultural Association, the Northwestern Fruit Growers Conference, the Washington State Grade and Pack Conference, the Northwest Potato Growers Conference, the Washington State Beekeepers Association and the Inland Empire Beekeepers Association will be held at Spokane, December 13-17.

Improvement of Nursery Stock

By L. B. Scott Before Ontario Institute

THE improvement of nursery stock is a subject which is worthy of serious consideration. Any factor which tends to improve nursery stock is one which should interest fruit growers. In this connection I know of no more important thing than the proper selection of bud wood and the proper type of bud wood to use in nursery propagation.

While the fact that bud variation exists in horticultural varieties has been known for many years, it remained for A. D. Shamei of the United States department of agriculture to point out the great frequency with which bud variations occur, and that by means of careful bud selection the better strains and the best individuals within these strains could be perpetuated. Mr. Shamei was the first man to realize the great importance of bud selection and his comprehensive investigations, which were begun in 1909 for the United States department of agriculture and which have been continued without interruption by him and his associates since that time, have meant a great deal to fruit growers, not only in California, but in all parts of the United States. In fact, all sincere attempts at the improvement of fruits by bud selection have been a direct outgrowth of his investigations.

The investigations which Mr. Shamei and his associates have conducted for the federal department with citrus and deciduous fruits, in addition to showing the variation which exists in many established orchards, have also pointed out the reason for this variation, namely, the lack of care which formerly has been used in the propagation of trees. It was the common practice of nurserymen engaged in propagating any fruit to cut buds from nursery rows and from nursery prunings or, if buds were taken from orchard trees, to make no attempt to select them from trees which were known for their bearing qualities, but simply to cut bud wood where it could be obtained at a minimum of time, effort and expense.

The department investigations have shown that several years records must be secured before any individual tree can be designated as suitable for use as a source of bud wood. As a

result of this work the term "selected bud wood" or "performance record bud wood" has come to mean bud wood cut from superior bearing orchard trees on which actual records of the amount and quality of fruit produced by all the individual trees in the orchard for a series of years have been secured.

The formation of the Nurserymen's Bud Selection Association of California was heralded by fruit growers, nurserymen and others interested in California horticulture as a progressive step towards the solving of the question of securing a better type of bud wood, and thus assuring the public a better type of orchard tree.

We were at once confronted with the problem that there was an immediate demand for bud wood and, with the possible exception of a few olive and walnut records, practically no individual tree records of deciduous fruits had been secured in this state. I at once saw that it was impossible to furnish bud wood to the nurserymen this season which could in any sense of the word be called "selected." I also realized that if my time and that of other employees of the association were given entirely to the cutting of bud wood for this year's propagation that no attempt could be made toward securing a better type of bud wood for future propagation. We therefore began securing estimated records of production in a number of different orchards to see if this plan might not prove a short cut toward securing information regarding individual trees which could be used as sources of bud wood. A few weeks' work along this line soon convinced us that, while some progress could be made, the only way whereby we would feel absolutely safe in stating that we were in a position to furnish selected bud wood would be by securing actual individual tree records, as had been done with citrus fruits, for a series of years, and then only taking bud wood from the individual trees which, after a series of years, had shown themselves to be the best producers. Accordingly on July 31 the reorganized

plan of work for our association was presented and approved by our directors. This, in brief, was that the entire time of the investigational staff of the association would be devoted to the securing of individual tree records for a period of three years and that no bud wood would be furnished to the members of the association until three years records had been secured, which would mean that bud wood, which could be called "selected" or "performance record bud wood," would not be handled by the association until 1922. It was further agreed that bud wood would only be cut from bearing trees in established orchards and that the owners of the trees would be paid a reasonable price for the bud wood. Acting on this plan we immediately began securing individual tree records and since that time have secured between 15,000 and 20,000 individual tree records of the following varieties: Prunes, French, Robe de Sargent and Imperial; peaches, Paloro, Albright, Sims and Phillip's; pears, Comice, Winter Nellis, Glout Morceau, Beurre d'Anjou and Easter Beurre; apples, Winter Banana, Bellflower, White Winter Pearmain and Newtown; and a few walnut records.

In order to supply the buds which are used by the different members of the association of the important commercial varieties of deciduous fruits, it is necessary to secure a great number of individual tree records, as we will undoubtedly find that in many orchards not more than ten per cent, or at the most 20 per cent, of the trees will prove suited for sources of bud wood. If the work is extended to include all the other varieties which are now being propagated by members of this association, as it is hoped it will be, it will be necessary for us to secure somewhere in the neighborhood of 75,000 or 80,000 individual tree records.

Judging from our experience in securing records this year we have been able to estimate the cost to the association when the work is extended to all varieties commonly propagated. The records can be secured at a cost

of not to exceed \$20,000 per year, which cost will include salaries, office expenses and all field expenses, which, considering the magnitude of the work involved, is a very small sum of money.

The following is a summary of the actual production records on 1,056 French prune trees. These trees are five years old and the data is presented at this time because the soil conditions and other environmental conditions in this particular orchard are as uniform as probably can be found in any place in the state. In studying these figures you will notice there were 65 trees which produced 100 pounds and over, 32 trees from 90 to 100 pounds, 152 trees from 80 to 90 pounds, with the largest number of trees ranging from 40 to 80 pounds. There were, however, 74 trees which produced from 30 to 40 pounds and there were 64 trees which were found to produce from 0 to 10 pounds. These records are not only suggestive but are very interesting, in that they show the great amount of variation which exists in this particular orchard, which was considered by the owner as the most uniform block of prunes he had knowledge of in his locality.

The work of the association this year, at least, has demonstrated conclusively that it is not an impossible task to secure a sufficient number of actual individual tree records so that individual trees can be picked out which can be used as sources of bud wood. It has further shown that it is possible to cut all this bud wood from trees in established bearing orchards, provided the public is willing to wait a few years until a series of records can be secured.

Nurserymen's Bud Selection Association

By Max Crow

THE first steps toward the formation of an association for the selection of buds on a commercial scale for propagating purposes were taken at the 1919 meeting of the California Association of Nurserymen at Chico a year ago. Wm. T. Kirkman, Jr., president of the Nurserymen's Association at that time, is chiefly responsible for getting the work started on a practical basis; it was he who urged the association to get busy, and his efforts resulted in the appointment of a committee of five to meet in San Francisco within 30 days to devise a plan for the organization of a practical working association. This committee met in San Francisco on December 18, 1919, and after long discussion of ways and means all present signified their willingness to assist in putting the movement on its feet, and the following nurserymen being present they were appointed to act as directors for

the first year and to arrange the necessary preliminaries: Wm. T. Kirkman, Jr., J. E. Bergtholdt, J. S. Armstrong, Geo. C. Roeding, Max J. Crow and H. A. Hyde. Subsequent meetings as necessary were held, articles of incorporation filed, by-laws adopted, and the Nurserymen's Bud Selection Association of California was formally launched with a capital stock of \$150,000, divided into 1,500 shares of a par value of \$100 each. To date 233 shares have been subscribed for by 17 nursery firms.

The preliminary work necessitated many meetings covering several months so it was not until February 20, 1920, that a general manager was appointed and the directors began to feel that the wheels were really turning and that much valuable work could be accomplished during the following fruit season.

During the organization of the bud association the men engaged therein had nothing whatever to guide them; the ground covered was absolutely new and naturally some mistakes were made; but persistence, a full realization of the benefits to be gained for the fruit interests of the state and a give-and-take spirit carried the thing along and I am perfectly safe in declaring that the Nurserymen's Bud Selection Association of California is an accomplished fact and so firmly established that its principles will be carried on for all time to come.

Some seem to think that the benefits from the association will be all to the nurserymen. The actual facts are that 95 per cent of the benefit from the work we are doing will be to the orchardists of this state. All the nurseryman will get out of it is the satisfaction of giving his customers a

tree always true to name and propagated from good parentage, and possibly a few cents above the scrub tree price to cover the actual cost of the extra care and expense of genuine bud selection.

During the past summer we have had from three to five men constantly in the field, examining, tagging and getting production records on the various fruits as they ripen. Up to date our workers have secured individual production records of 7,912 prune trees, 4,076 peach trees, 1,407 apple trees, 1,712 pear trees and 458 walnut trees. In addition to this several orchardists have been located who, for several years, have been in the habit of keeping production and other records of the individual trees in their orchards, and I am glad to say that in nearly every case these public spirited men have given, or offered to give, the association copies of their

EDITORIALETTES

Californians are wondering over the Johnson immigration bill. It was rumored that all immigration was to be prohibited for a period of 12 months excepting that America's "treaty with Japan" should be honored and the Japanese permitted to come. After passage of the bill by the house wire announced: "All immigration restricted for one year." Californians are wondering whether these dispatches mean what they say or whether there is to be a favored nation.

Later it develops that the bill as passed by the house provides complete exclusion—with some exceptions such as students, artists, etc.—and will doubtless be vastly more effective than the "Gentlemen's agreement."

The postal savings rate is still two per cent. These funds are deposited in banks at two and a half per cent. This is good business. But the government still needs money, so, to be liberal with the banks, it turns and borrows back from them some of its own money and pays six per cent—this on short time certificates. This, likewise, is good business—not. However, here is another angle which shows that the government is doing good business. The borrowing on these certificates at six per cent is a powerful aid in hammering down

values of Liberty Bonds which are drawing only four and a quarter per cent. This has resulted in a loss to the people of around \$14 on each \$100 they advanced to the government. Here is where good business comes back, for the dispatches announced only a few days ago: "Federal government clears over \$100,000,000 in buying its own bonds." Good business—poor ethics.

Put a candle in the window on Christmas eve. It is a beautiful custom in many cities. Why should not the rural homes all over the country send out their rays of cheer? For many years Cleveland, Ohio, through certain musical organizations has had groups of carol singers who go from house to house, at least to those having the lighted windows, and sing carols and accept offerings in aid of worthy and needy young musicians. This year all energies are bent toward saving the starving children of Europe and Asia, and the response is proving liberal, though, no matter how liberal, the full needs of those suffering countries cannot be met. Put a light in the window.

Not content with having all the candidates for president within her borders, Ohio is now ready to aid in cabinet making. She seems to have a well working publicity bureau pushing for secretary of agriculture. All we can say to Ohio is: "For the love of Mike! Be reasonable!" California has two or three candidates; give them a chance to speak their pieces.

The farm bureau folks had a great convention in Indianapolis last week. They discussed the awful financial situation in which many farmers find themselves, and in discussing some transactions at Washington, in which they asserted farmers were discriminated against, they omitted the dis.

A few sentences from the resolutions: "The present price situation has lost the American farmers seven billions this year." "Need of rural personal credits important." "Increase farm loan limit to \$25,000." "Condemn interstate commerce commission for valuing railroads at five billions in excess of commercial value." "Return to states power to regulate rates, car distribution, etc." "We demand enactment of Truth in Fabrics bill." "Right demanded as to collective bargaining." "Delay action as to stockyards till committee of 15 investigate." "Women membership approved." Daylight saving condemned." More next week.

DREAMING DREAMS

Since the days of '49 Californians have stood on the river banks at times of winter floods and lamented the passing of all that wealth as an element of destruction and wished it could be held until mid-summer and poured upon the thirsty land. The standing on the bank has continued all these years with but few examples of action. There has been occasional flood conservation and rich crops have resulted, but this so seldom as to serve merely as a striking example of what we should all be doing. We have united more or less in shouting "Store the Floods." Several have dreamed these dreams of utilization of the wealth nature has given to us. More recently there has been direct action, or at least request for action, with gathering of data which may convince the majority of us that the time for doing has arrived.

Col. R. B. Marshall, either as an engineer of the U. S. geological survey, or because of his own desires, has been gathering of the Sierra Nevada information as to some of her resources, and has dreamed of a great system of canals in which the flood waters of the Sacramento, after being stored in the mountains, shall be carried around the northern end of the Valley and down its west side even to the middle of the San Joaquin Valley, and again another canal shall gather of the waters of the Feather River and, as it passes down the foothills pick up the stored floods of the American, the Calaveras, the Mokelumne, the Merced, the San Joaquin, the Kings and even scores of other rivers and carry them down the east side of the great central valley, even into Kern County, around the southern end of the valley and up to meet the great canal which comes down the west side. Again, the waters of the Kern shall be taken through the mountains, through even 30 miles of tunnel, and poured over some of the rich valleys of Southern California. The cost is enormous, even to hundreds of millions, some think possibly to a billion of dollars, but even then the assertion is made: "California can do it."

We recall that some years ago when the city of Los Angeles was only a third its present size and its people not possessed of great wealth, there were those who said "It can't be done," when that little city, with its inhabitants almost as one, decided to bring the waters of the country's highest mountain 250 miles. "It will cost \$40,000,000 which is a greater burden than the people can bear." They raised the money; they brought the water to the city; the city has grown beyond the wildest dreams; it has grown until today engineers are making investigation and find that if this rate of growth is to be continued, in 40 or possibly 45 years new water supplies must again be secured.

Now has California faith in her own resources, her own capital and her own engineers? Col. Marshall's dream is not yet complete in all its details; it may be even wild in some of its particulars; but nothing is too big for California, and we believe the people who are seriously asking as to the future possibilities of this state are wise in giving attention to these dreams and to the association which has been formed to make them come true.

WILD JUSTICE

Some states of the South which have looked with more or less of approval on the work of vengeful and uncontrollable mobs now find opportunity to divert attention and are pointing toward the Pacific. Some Californians even are pointing to the town with saintly name north of San Francisco Bay and charging her with bringing terrible disgrace upon our state. A horrible crime—or many of them—was committed and swift justice visited upon the criminals, and some of us are asking of Santa Rosa why she did it.

But is Santa Rosa or any one community alone responsible? The crime, or rather the series of crimes, which resulted in the lynching began in San Francisco. We may say they began there many years ago. It may be recalled that but very few years ago a movement was started, led by the minister of one of the churches, in an attack on the dens of vice. The move-

ment was charged by some with being the work of fanatics of one single church organization, and many felt at the time, in fact, it was openly claimed, that the movement was not fully supported by peace officers nor courts. And since that movement subsided it is freely said that there has been more or less of winking at various violations of moral and civil law.

We may go back still farther and to the southern part of the state. An October morning in 1910 witnessed a terrible explosion from dynamite in which 21 persons lost their lives. The perpetrators, some of them, were captured, and two, at least, made confession in order to escape the extreme penalty. Another was later captured and sentenced to a term, we believe it was ten years. He is now seeking parole.

Again, only a few weeks or months ago a fiend was accused of being a super-Bluebeard and marrying and then murdering a dozen, or was it a score, of women. Because of the difficulty in securing evidence, which "difficulty" seemed astounding in view of the facts which were later shown, a confession of the crimes was accepted with agreement to remit the extreme penalty.

When the basest and most horrible of crimes can be committed with this apparent immunity from extreme punishment, why should people with basest desires make effort to control? Why even hire an attorney when escape from enforcement of the laws of the state is so easy? Again, coming nearer, or to November 2, 1920 when the people of the state of California said; "We will have nothing of 'An Act Enforcing the Provisions of Article XVIII of the Constitution of the United States.'" The people who said in effect: "We will have nothing to do with the constitution of our country," did not mean their verdict to be taken as it has been by many, nevertheless it was an expression which could be construed in only one way by the criminally minded.

We are horrified that such action seemed necessary in California, but it may serve as warning to our courts and peace officers that if the servants of the people do not vigorously enforce its laws, the people will.

When the procedure of our courts and the practice of the law has come to be so largely devoted to quibbling over technicalities and to legal evasions of law, while the most beastly and indefensible crimes go unpunished or lightly punished, it is evident that the time has come for a reconstruction which will allow administration of justice.

A VOIDING ACCIDENTS

An Eastern town has enacted a very simple, short and effective ordinance. Practically the entire text consists of "At all street intersections the man at your right has the right of way." If we could all remember that it would be the greatest of all preventives of auto accidents, that is, if we except reckless speeding. Unfortunately, prevention of accidents calls for common sense, and that seems to be especially lacking in many drivers of automobiles.

It will help some if we all try to remember the above concise rule. If we are driving north the man going west has right of way; likewise if we are going south the man from the west. But the simplest of all is to remember "the man at the right."

For the Good of the Greatest Number

Two distinct aims, each of them conceived in the interest of the public we serve, have animated this Company in all its activities since the beginning.

One is to produce products of uniformly fine quality; the other is to manufacture and distribute these products in sufficient volume to keep their cost low.

The passing years have seen the things Goodyear builds move steadily onward in excellence, and in the abiding public regard that such excellence always compels.

Today the millions who use these products enjoy the economy not only of intrinsic goodness, but of relatively low price made possible by immense and growing sale.

In no other article we manufacture has this process of advancing worth and receding cost been more evident than in Goodyear Cord Tires for passenger cars.

By improved construction, by an enlarged capacity for service, they have held their measure of value intact against even the rising costs of material and labor.

Goodyear Cord Tires deliver today a kind and extent of performance that for reliability and final economy is unapproached in any earlier type of tire.

Because Goodyear Tires and the sincere conservation service behind them afford uncommon satisfaction, more people ride on Goodyear Tires than on any other kind.

THE GOODYEAR TIRE & RUBBER COMPANY

Control of Mealy Bug

Investigations by R. S. Woglum of the United States department of agriculture of the citrus mealy bug (*Pseudococcus citri*) resulted in the discovery that it could be successfully controlled by four important predators (*Symphorobius*, two species, *Hyperaspis* sp., and *Cryptolaemus* sp.) provided ants, particularly the Argentine ant, were eliminated from the infested territory.

The control of the Argentine ant by use of poisoned syrup having been accomplished, it was found that *Cryptolaemus* was the only one of the four predators which fed freely on the citrophilus mealy bug (*P. gahani*), but that other important predators of this pest were the *Leucopis* sp. and *Scymnus* sp. The combined efforts of these species failed, however, to control severe infestations, although quite effi-

cient in lighter infestations. Spraying with the insecticides effective against the citrus mealy bug did not prove satisfactory, and fumigation proved to be a failure.

Studies of the citrophilus mealy bug revealed a spring migration of the mature females to the trunk and rough places on the main branches, where they deposit the egg masses for the succeeding generation. This led to the use of burlap bands on the trunks, applied not later than April 1, as an additional inducement for the insect to oviposit there. The trunks and lower main branches were subsequently sprayed with an effective insecticide (soap powder, 40 pounds; distillate crude, 28 per cent, 30 per cent Baume, 10 gallons; water to make 200 gallons) before the eggs hatched. In this way a 20-acre demonstration plat was cleaned up.

Citrus Canker

In a contribution from the bureau of plant industry, United States department of agriculture, results are given of an investigation to determine whether or not the citrus canker organism (*P. citri*) is capable of persisting in the soil to such an extent as to make the soil an important medium in holding over or disseminating the organism.

Tests on many types of soils showed a rapid decline of *P. citri* in all. This decline was retarded slightly by rendering the soil alkaline with lime water or by lowering its temperature, and more decidedly by withholding water or by previous sterilization with steam. Extremely long persistence in

small numbers was noted in soil held in air dry condition. *P. citri* was found to penetrate the soil to depths ordinarily cultivated, but the normal decline seemed to occur at such depth. In water the decline was more rapid than in soil, but previous sterilization of water had a decided effect in prolonging resistance. Certain bacteria commonly found in soils are said to have a marked deleterious effect on *P. citri* in artificial culture media, and the presence of such organisms in soil is believed to be concerned in producing a decline of *P. citri*. Young roots of grapefruit seedlings did not seem to be readily infected except through wounds.

From Schoolroom to Vineyard

By Ernest Brauntou

This is a story of Tokay grapes grown by an amateur, with a high degree of success, a success attainable by any person who will diligently apply a little thought and muscle to the task of starting a vineyard. E. H. Ride-nour, a school teacher of Stockton, secured ten acres of land near Lodi, San Joaquin County, 18 years ago, and having a little means secured cuttings of Tokay and a few other varieties, rode out the 14 miles from Stockton on Saturdays and holidays on a bicycle, planted the cuttings and attended to their needs with his own hands. They all grew.

The vines are planted ten by ten feet and have never been irrigated or fertilized yet the ten acres have grown to 33. In 1919 the crop was 600 crates of 28 pounds to the acre. This year the crop is slightly less than last year but on September 1 Mr. Ride-nour refused \$400 an acre for the crop on the vines, the purchaser to take all risks regarding weather, labor, car shortage, etc. (and the latter already exists.). This is the fourth year of light rain in that section, and during last rainy season but seven inches was precipitated, yet this vineyard is in fine condition. Tokays are picked when testing 17 per cent sugar, but while they now test from 17 to 21, no picking has been done for the grapes are very slow in coloring.

In this vineyard pruning is done just before the bleeding stage, if possible. If done earlier and hot winds come the stubs dry out too much. Some vines in this neighborhood are on their own roots, some on *Rupetris* St. George, some on *Lenoir*. The latter is favored for heavy soils. *Phylloxera* is not present and few pests hamper; occasionally leaf hoppers and a beetle that eats the leaves appear, but not in serious numbers. Dust appears the vineyardist's chief trouble, and along unimproved highways the loss is often quite serious on two or more rows next the road. To overcome contamination by dust in the vineyard described, straw is

scattered freely in all rows down which grapes are hauled. A new variety known as *Huniola* is being tried and gives much promise. It is midway in color between *Emperor* and *Tokay*, but skin is more tender than that of *Emperor*. It is a slightly smaller grape but a heavy bearer and has but one seed, sometimes none.

APRICOT DISEASE

That the disease known as bacterial gummosis, which has attacked the apricot in practically every important apricot growing district in the state, is most active in the late fall and winter months and that the grower should remove the infected bark with disinfected tools, treating the wound also with proper disinfectants, are the statements made by J. T. Barrett, professor of plant pathology, University of California. The disease is comparatively new to this state, having been first recognized in 1916. The first visible symptom is an exudation of gum, usually at or near diseased fruit spurs.

NEW CATALOGS

The plant catalog season is at hand and the first one to arrive is that of the Armstrong Nurseries, Ontario. It has nearly all its old features and many new ones. The one of most value to our readers is a section entitled: "Planting Instructions for Tropical and Sub-Tropical Trees." The most striking of the new illustrations are those of the *Haden* mango and the six citrus fruits they are budding on one tree for use in small gardens and also for the fun of watching so many varieties develop on one trunk, giving citrus fruits of some sort every month in the year. This catalog contains the fullest list of sub-tropicals of any yet issued in California.

A good septic tank should be water tight, prevent agitation of the contents by inflowing sewage, and include a sand filter bed or subsurface disposal system to accomplish the final work of purification.

Bean Power Sprayers

Bean Power Sprayers have a long and wonderful record of results—increasing orchard production, bringing neglected orchards into successful bearing, controlling pests, and helping growers to better profits. The Bean was the first successful spray pump ever offered to the fruit growing world. That was 36 years ago. Since then a multitude of sprayers have come and gone, but the Bean has maintained its lead from the start, and today is recognized as *standard equipment* everywhere.

To say that a sprayer is "as good as a Bean" in any particular feature is to say the best that can be said of any sprayer—only there is no sprayer as good as the Bean except the Bean itself!

"Bean" is more than the name of a sprayer—it's the name of a Service. Two large factories—one in Lansing, Michigan, the other in San Jose, California—serve both east and west. Out from each plant there travel a corps of trained sprayer experts whose business is to co-operate with the grower. And in every fruit-growing section is a resident Bean distributor.

You are never more than a few hours away from a complete stock of Bean Parts and Accessories, a Bean representative, and Bean Service.

Send the coupon. Get the new Bean catalog. It illustrates and describes the entire Bean line from the Bean Magic Hand Pump and the sturdy little Bean Baby Simplicity (a wonderful little one-man power rig) right up to the Bean Super-Giant, the largest and most powerful spraying machine that's made. Do the right thing first—get a Bean and you will get results.

Hardie
Triplex
Sprayer

The Kind of a Sprayer Twenty Years Experience Gives You

The Hardie Sprayer represents the best that has been developed in our twenty years of exclusive sprayer and sprayer equipment manufacture.

For instance, the famous HARDIE Triplex pump is the most efficient, smoothest running pump made. The HARDIE pressure regulator holds the pressure right to the dot. The suction chamber keeps out all sand and foreign matter.

As another example the HARDIE Ideal engine is a high duty, high quality engine which has been so carefully worked out, and refined through the years of experience as to be as near trouble proof as human ingenuity can devise.

Another thing which the experience of years has brought is weight reduction to the lowest possible amount consistent with ample strength. It has brought about the underslung frame with consequent low height so valuable in working under low trees.

You can't go wrong with a HARDIE. They are proved right. Ask any HARDIE owner. See the HARDIE dealer or write direct.

Prof. Bioletti Prunes Grapes

By Ernest Braunton

IN KIRST Brothers ranch at the east end of the La Canada Valley, Professor F. T. Bioletti of the state agricultural college pruned five varieties of grapes in the presence of 100 or more interested observers and auditors who were keen to see and hear this famous specialist. For he "sheds" his coat and goes at the vines as though his life's work had been vineyard pruning. The first variety operated on was one of the less vigorous, known as

Mataro

"You can't put grapes on a vine by pruning. Only care will do that. But you may put grapes off by pruning. Conditions determine the crop. We prune to allow vines to produce what they will, shaping largely for convenience. First, get a clean, straight single stem, without wounds and resultant scars, so you may cultivate beneath the head and also see that no suckers grow from the trunk. Stems early allowed to sucker or sprout and afterward pruned clean will not produce vigorous vines, and scars will encourage entrance of insects and induce fungous growths. Stake all vines when young.

"Allow two to five arms to grow, according to variety and to properly distribute crop. Do not allow these arms to become too long or vine is weakened and arms may break or split off. The crop is partially dependent on number of fruit buds, but do not leave too many. Properly balance so as to get maximum crop and maximum quality. If vine made normal growth, leave as much wood as left the previous year; if growth is weakly leave less. The ideal is to have the head or crown vasiform, but occasionally it is advisable to leave a cane in the center." The next talking and pruning was bestowed upon an

Emperor

"This is one of the strongest and most vigorous growers and needs good heavy soil and plenty of water and should then bear eight or ten tons to the acre. This soil is too sandy for Emperors and I am not sure how I should prune. The variety will not thrive here even with good care. After more than a score of years of careful study and experiment I am not sure that fertilizing aids grapes, though much of it is done. Cultivate, irrigate, prune and care for grapes and the crop problem is solved. Stake Emperor high, one cane only (on all varieties), and leave four or five spurs, or longer growths than were left on the last variety, a weaker vine than this sort. Stake high, a four or five foot cane. This vine has two original stems (saws one off). One is as good as 14 for you can't get more spurs, and pruning is much complicated. Never prune any vine so long as green leaves remain or you are pruning away the food factory, therefore losing grapes and permanently weakening vine.

"The commonly accepted practice with Emperor is the vertical cordon and to leave two or three buds on every lateral, for it is of great vigor. But vertical cordons have disadvantages. The crop ripens at different heights at different times and in different shades of color. This variety must have an abundance of sunshine and so the vine will go as far from the root as it can. Finally, the head becomes high and strong and the lower canes dwindle and die. A later, and perhaps better method of training is a horizontal cordon, tied to a wire continuous one way throughout the vineyard, preferably north and south, using but one cane as in the vertical cordon. Paint wounds or cuts on trunk with asphalt and cover with soil, but we seldom paint wounds or stubs above, but if done use light colored material for the black asphalt induces sunburn.

Muscats

Prune to keep vine head high and clear above soil. Don't let frame spread too far or too horizontal. If it becomes so, leave for present year to get crop, but encourage new growth

from center and next year cut old arms away. I am leaving 50 per cent more wood than was left last year for this vine is a strong one. These prunings are too long jointed for good cuttings which, if short jointed, need be but 12 to 15 inches long. Roots which come out not more than 12 inches below surface are best on all vines. If they appear at this depth and others appear on joints above, cut upper ones off and shorten those below. In very light soils cuttings may be long or roots will dry out; if too long in heavy soils lower ends will rot. Cut lower end of cutting close to joint, but don't cut "ring" away. Do not leave stubs below, to rot away, for borers enter only through dead wood and from this go into live wood. One-fourth inch of pith below is ample but leave an inch above joint at top end. In planting leave one bud above and one at top of soil. If anything happens to one, the other may live. Make cuttings now or later and need not plant until March.

Cornichon

"This is called half-long pruning. Leave long spurs (four buds) for crop and short spurs for next year's bearing canes, for old ones should be cut away. On weaker canes leave shorter spurs, of two buds. You will note these vines do not like strong winds, as nearly all growth is on one side. Always leave long spurs on Cornichon and as in other varieties, cut away canes below or those drooping, but do not leave old wood too long. Too many 'water sprouts' suggest you have not left wood enough. Leave all water sprouts above or from top of crown, but none below. Muscats are of the weaker varieties.

Tokay

"The Tokay is a medium strong variety, yet not so strong as Emperor. Pruning depends on vigor of vine. Leave spurs of three or four buds. In Imperial Valley we prune a year old vine as you do a two year vine here or a three year old in the more northerly counties. All vineyards should be staked; you cannot get good vines without it. Cut top of young vine close down to a joint and tie just below this joint to the stake, just as hard as it can be tied. This upper joint will not grow, but it prevents wind blowing vine out of string. Ties below should be very loose, so you can run your finger through the loop."

A score of boys from the seventh and eighth grades in elementary agriculture were present from the Los Angeles schools, with three supervisors, and Professor Bioletti complimented some of the boys on the very intelligent questions they asked him.

CALIFORNIA MANGOS

Every tropic and sub-tropic land has striven to grow the mango, considered by many the world's finest fruit. It is yet to be demonstrated if California can produce mangos of good com-

The Haden Mango

A hardy variety now being tested in California. One-third natural size.

cial value. Several seedlings have fruited well in favored spots, but none of real merit. Nearly all have been too full of fiber or have had a strong disagreeable flavor. The best the writer has eaten were excellent as to taste but the seeds were so large that there was little flesh.

At Delhi, India, about 1330 a Turkoman poet wrote in praise of the mango, stating it was the world's finest fruit, and it is evident that it had been so esteemed for centuries. An Indian emperor who reigned in the sixteenth century planted an orchard of 100,000 mango trees and 300 years later English horticultural explorers found some of these trees still in good condition and yielding well. Many later writers referred to the mango as the finest of tropical fruits.

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards six times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand and Fleur de Soufre, packed in double sacks, are the fluffiest

and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men \$5 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill into the soil 220 POUNDS PER ACRE of TORO BRAND SPECIALLY PREPARED AGRICULTURAL SULPHUR—or our DIAMOND "S" BRAND REFINED POWDERED SULPHUR. This soil treatment has increased various crops up to 500%. Send for Circulars No. 6, 7 and 8.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur, Mixtures, etc.

Carried in stock and mixed to order.

PROTECT PRUNING CUTS

Tree cuts or wounds, if left exposed, are very likely to become infected. Prevent infection by prompt application of PABCO PRUNING PASTE. Ask your dealer. Manufactured by the Paraffine Companies, Inc., San Francisco, California.—Adv.

Of late years special efforts have been made by the United States government to find varieties of merit suited to the warmer parts of this country, for they are common in all parts of tropical America. In Florida their range is necessarily too far south for production of really good fruits and varieties are needed that will flourish in the citrus belts of that state and California. With that end in view the bureau of plant industry introduced the Mulgoba, which has now been displaced by the hardier Haden. None of either are yet fruiting but it is expected that edible fruits of Haden will soon be available from vigorous young trees now growing in warm spots. It may seem strange to Californians that this king of fruits belongs to the same family as the poison sumac (poison oak) and the so-called pepper tree. But the excellent pistachio nut is equally closely related.

—E. B.

CONTROLLING APHIS

The U. S. department of agriculture is giving particular attention to that universal pest, the aphid. It has issued "Control of Aphids Injurious to Orchard Fruits," written by Quaintance and Baker. It is Bulletin 1128 and may be obtained free by writing Division of Publications, Washington, D. C.

Aphids are small, delicate, winged or wingless insects which feed upon plant juices, draining them from the foliage, fruit, twigs, or roots, through a beak pushed into the plant tissues.

Many kinds injure orchard fruits, currant, gooseberry and grape. The most important are discussed in this bulletin.

Contact sprays, such as kerosene emulsion, soap washes, nicotine solutions, etc., must be used to kill aphids. Directions for preparing and applying them will be found in the bulletin.

Stomach poisons, such as arsenate of lead, Paris green, and other arsenicals, are of no use against aphids.

Species which winter in the egg stage on the plants to be protected may be sprayed early in the spring as the buds are expanding, to kill the first brood and insure against injury later in the season.

Leaf curling species, especially, should be treated with this bud spray in years when they are expected to be abundant. They cannot be reached satisfactorily after the leaves have unfolded and the aphids have begun to be troublesome.

Those species which do not curl the leaves may be controlled readily by sprays when they are noted as becoming numerous.

Annual bud spraying in the case of the apple appears to be good orchard practice and, continued for a series of years, doubtless would prove profitable.

SPREADING AVOCADO INFORMATION

William A. Spinks, the avocado enthusiast of the foothills above Monrovia, was recently in New York. The Waldorf Hotel people deemed it an important occasion in that Mr. Spinks gave those who cater to discriminating people some information regarding California grown avocados. They made rather an interesting story of the "avocado pear," which they say "should be called ahuate." * * * "The fruit matures constantly during the spring and summer months." We think, however, if the Waldorf-Astoria people will visit California or give us definite order for fruit to be delivered any month in the year we can soon fill the order.

GROWERS ORGANIZING

Secretary Bigelow of the state market commission announces formation of the Imperial Valley Vegetable and Melon Growers Association, the Coachella Valley Onion Growers Association, the Lakeside Fruit and Vegetable Association, in San Diego County; the Carlsbad Vegetable Growers Association, in the same county; the Merced Vegetable Growers Association, the Fruit Growers Association of Riverside County, the Cherry Growers of California and the Poultry Producers of Imperial Valley.

FAGEOL

WALKING TRACTOR

Fageol owners are our best salesmen. Wherever the tractor is introduced, the owner becomes immediately enthusiastic and spreads the news of its unusual performance and dependability, and his neighbors soon fall into line.

If he needs more horse power, he invariably orders another Fageol. Repeat orders are coming to us in ever increasing volume.

When Writing Advertisers Mention California Cultivator

Varying Orchard Culture

About the middle of August a representative of the Cultivator spent some time in the orchard of E. A. Marshall at Porterville, Tulare County, for Mr. Marshall seemed much puzzled over the unsatisfactory condition of much of his orchard. The soil is very heavy and had not been plowed for several years. It evidently needed plowing very deeply, subsoiling, in fact, and organic matter introduced to prevent it again becoming impervious to air and water. A portion lately plowed deeply and heavily irrigated was the only part making new growth. H. L. Morrison, secretary of the Porterville chamber of commerce, was present, and we have just received from him some data on this and other local orange orchards.

"Six years ago Mr. Marshall purchased this orchard and at that time the trees were in fairly good condition.

He forgot about the plow, using the disk only until his trees 'went back.' This summer, in July, Mr. Marshall in one portion of his grove began plowing deeply and irrigating every 15 days lightly. In one month's time he had a wonderful new growth on his trees. At the present time he is following the old idea in the remainder of his grove, but when I asked him regarding splits he readily admitted injury and said: 'There are not so many splits on the trees where I am irrigating every 15 days as there are in the remainder of the grove where I irrigate only every 30 days.' This same answer I am getting from a number of other growers. The trees at the present time are 14 to 18 years old and the particular portion that we traveled over when you were here has a very heavy crop of fine fruit, which we believe is produced by plowing deeply enough to cut through the plowsole. He has

sprayed twice during the season for red spider, has irrigated every 15 days, and has stopped all pruning.

"In going from one grove to the other in this section, we find four things that are being done by the suc-

cessful growers: first, they have stopped pruning; second, they practice deep plowing; third, they irrigate every 15 days, or often enough to keep the soil in moist condition; and fourth, spray. The spraying can be carried

A Tulare County Orange Tree
In the orange orchard of E. A. Marshall, Porterville.

on to such an extent that it is dangerous to the life of the trees. The average grower pays so much per tank to the men who are putting the spray on. We find a number of men who, knowingly or unknowingly, are causing a decided loss to the growers. Instead of using the spray nozzle as it is originally built, they bore a larger hole in the center of the nozzle, throwing a stream instead of the spray required. We also find that you can use the same spray on two groves, on one without any harmful effect and in the other the trees will be burned. This we believe is caused by the condition of the trees or, in other words, if the trees are in a healthy condition the spray can be applied without danger. If the soil is allowed to dry the trees have not the natural resistance, and when the spray is applied the foliage is injured, while trees in good condition are not."

NURSERYMEN'S BUD SELECTION

(Continued from Page 789.)

records; so that for next summer's cutting we will have access to more than 20,000 trees on which we have a production record of at least one year.

Some will say that one year's production is not sufficient to establish a record. That is fully granted. The association has no intention of claiming anything not actually borne out by facts. We realize that before we can give our customers a tree truly pedigreed, records covering anywhere from five or ten to 12 years must be secured. On the other hand, I do not think there is a practical orchardist in the state today who will not say that just one year's record is of some value. I think all will admit that propagation from a healthy, vigorous tree, typical of a given variety, which tree has a record for even one crop of large fruit and lots of it, will produce nursery stock which has a far better chance of being profitable in the orchard than a nursery tree grown by the hit and miss methods of the past; and as time goes on we will be able to secure additional production records, to get subsequent notes on variations and desired characteristics, and each year the nurserymen members of the bud association will be advancing a step, giving their customers a little better stock than the year before and gradually working toward the time when we can send out nursery stock with as valid and genuine a pedigree as any Holstein or Jersey in the country. So please do not think that the Nurserymen's Bud Selection Association is promising the planter more than can be given him. All we claim for the present is to furnish a tree a degree better than the one it was possible to produce the year before.

During the summer of 1921 it is our aim to have enough competent men in the field to furnish practically every bud used by our membership; all these buds to be taken from the very best trees as shown by the records secured during the summer of 1920. On many of the parent trees we will be able to have a two years record as a number of fruits such as apricots, cherries and other early sorts will have borne another crop before bud cutting time is on.

Our membership must agree to in-

Over Another Threshold

SOON you will put the calendars of a new year up on your walls. You have weathered the labors of the past four seasons—with what benefits and damages you recall full well. Now the cycle of a new year looms ahead, and we must prepare to gather the fruits of 1921.

It is a time when conservative manufacturing enterprises and business houses are reviewing the past, taking stock of resources, and building future campaigns. Leaks are stopped, needs are reckoned with, and plans are made with extreme care.

Winter is the best time in most sections for complete farm inventory, for overhauling machines and making repairs, for accurate reckoning of profit and loss, for planning crop changes, for discarding old habits and considering new methods.

Every farmer knows this. It is good to see that there is more and more definite planning of full year's work at the close of every December, on the farms of America. It is so easy a matter to slide through the comparative resting period of Winter, and then Spring with its hundred duties bursts forth and finds many important matters and details unattended to.

We are glad to note this trend toward business-farming because we hope to be allied with Agriculture many more years and because our interests are so closely mingled with the interests of the farming world. So then, while we are setting our own house in order for 1921, we pause to publish the hope that you, the reader, may set forth into a new year of farming enterprise with all plans laid for a most profitable twelve-month.

INTERNATIONAL HARVESTER COMPANY

sert no buds in their nurseries other than those furnished by the association, so far as the association is able to supply them. Members must agree to keep trees produced from buds furnished by the association entirely distinct and separate from any trees that may be, for any reason, grown from buds cut by themselves or other parties. Our members must permit the officials of the association to have access at all times to their records and nurseries and these officials shall be justified in adopting any necessary means to see that no tree is sent out as a selected tree unless the bud was furnished by the association. In other words, the association officials will see to it that only trees grown from buds furnished by them are sent out as

selected stock. Our membership has been unanimous in its determination to safeguard the integrity of our work and I feel perfectly safe in promising that any nurseryman attempting to send out stock grown from buds not furnished by the association, but claiming such trees to be selected stock, will be promptly dropped from membership and denied all privileges.

The question has been asked, why should an association be formed for this work; why should not the nurserymen do this selecting individually? If at all familiar with the nursery game a few moments thought will convince anyone that it is utterly impossible for any one nurseryman to handle the matter of bud selection in a thorough and practical manner. The state is too big, the number of varieties too great, to permit any one man to get really practical results. Furthermore, the expense would be too great to be borne by any one nursery; and, again, what nurseryman can sidetrack all of his other affairs and put in a whole summer selecting trees from which to cut his buds? He might do it for one summer, but could he do it year after year as will be necessary to get best results? The obvious answer is no to all of these questions. The only possible way that the work can be done properly is by an association having competent men who devote their entire time season after season in observing, securing records and cutting the buds of the very best types obtainable, for the association members.

As to the value of bud selection little need be said. It is not a new theory advocated by a few extremists. On the contrary, it has been practiced to a certain extent for more than 60 years right in these United States. E. P. Powell of New York, T. T. Lyon of Michigan, H. E. Van Deman, one of our former secretaries of agriculture, and numberless others of our leading horticulturists were and are strong advocates of bud selection; and you are all familiar with the astonishing results attained with citrus fruits during recent years. It is a universally accepted fact that livestock can be greatly improved by proper breeding. What is proper breeding? It is simply the selection of a certain type or certain types and the development of the desirable characteristics. It is known to work perfectly with livestock and in horticulture experiments have shown conclusively that a great deal can be accomplished not only in the fixing of certain desirable characteristics, but that production can be wonderfully increased simply by propagation from desirable parentage. The best horticulturists of the United States are unanimous on this point and right here in California our leading orchardists are demanding of the nurseryman that they furnish trees grown from buds selected with greater care than has been possible in the past.

I have endeavored to tell you what we have been doing in the way of bud selection this past summer and I hope I have made it plain as to our intentions in the future. The degree of success we will attain depends entirely on the support accorded by the nurserymen and by the orchardists. We want your support and cooperation. Since the formation of our association the 17 nurseries now members have contributed in hard cash more than \$16,000 and will have to dig down for about \$3,500 more to cover the expenses of the first year's operation. Now whether we get new members or not this work is going through. The present membership has traveled some rocky roads, but as we have our office and field equipment and a working organization the worst is over. If the other nurserymen of the state and the orchardists who will reap 95 per cent of the benefit should decline or neglect to come in with us we shall go right ahead and put the job over; but, personally, I feel that we have a right to expect the influence and financial assistance of the big horticultural interests of the state as well as of the small nurseryman who has the good of his business at heart. I am so firmly convinced of the benefit to be derived from the work we are doing that I have no hesitancy in predicting that ten years from now it will be practically impossible to sell a fruit tree unless it bears the O. K. of the Nurserymen's Bud Selection Association of California.

The CHEMIST says=

"genuine GIANT is always uniform"

At every Giant Powder plant the chemical laboratory controls the processes of manufacture. They make continuous tests that insure the unvarying high quality of Giant Powders. Each pound of Giant Powder is exactly like every other pound of the same grade. Such uniformity means economy, efficiency, safety. Professional users of Giant Powders—miners, quarrymen, contractors—all know that the name "Giant" stands for utmost dependability in explosives. When you have land to clear, trees to plant, subsoil to be broken or ditches to be blasted, tell your dealer to get for you one of the Giant Farm Powders—Eureka Stumping or Giant Stumping. Don't accept any ordinary dynamite, but insist on genuine Giant Powder, bearing the Giant trade mark on every box.

A postal will bring you our book, "Better Farming with Giant Farm Powders." Its 52 pages are full of short-cuts and labor-saving methods.

THE ONE MAN WADE

Does 10 Men's Work

No more back-breaking work! WADE PORTABLE GASOLINE DRAG SAWS CUTS 25 to 40 CORDS A DAY. Costs 4 to 8c per cord. Saws logs any size rate foot a minute. Wonderful motor delivers full 4 H.P. No complicated parts to cause trouble. BUILT TO LAST! Everywhere replacing old-fashioned methods. Thousands used in U. S. and foreign countries.

MOVE IT LIKE A WHEELBARROW!
The Wade's right at home in the woods. One man moves it ALONE. So simple a woman or boy can operate it.

POWER PULLEY FREE!
A power pulley goes with every Wade. With it you can operate light machinery of any kind when not cutting wood.

More Valuable Than An Extra Man About The Place.

EXCLUSIVE WADE FEATURES—
Automatic Safety Clutch
Quick Detachable Saw Holder
Non-Boil Over Tank
Non-Freeze Water Drain
Automatic Oiling System
Single Wheel Construction for easy moving.
Many others.

MAKE BIG MONEY!
Cut wood for yourself and neighbors. Many Wade owners earn \$200 to \$400 a month.

Learn more about this wonderful machine. Write at once for FREE book and price.

GHIRARDELLI'S

Ground Chocolate

THE CHRISTMAS TREE

It blooms one day in all the year,
Not when the roses blow,
But when the fields are brown and sere
Or robed in gleaming snow.

Upon its branches bending low,
All beautiful to see,
Both flower and fruit together grow,
Oh, wondrous Christmas tree!

And children dance in merry glee
And lovers whisper vows;
And trembling age draws near to see
And rest beneath its boughs.

And up above, in starlit space,
Beyond the gates of gold,
Perchance through all the heavenly place
Rolls round the song of old.

"Peace on earth—to men good will,"
That sweet and glad refrain—
Should not the angels sing it still
When Christmas comes again?

Green be thy branches, Christmas tree,
Thou plant of heavenly birth,
Thou hast the Summer's heart in thee
Though Winter rules the earth.

GETTING MOTHER'S CHRISTMAS PRESENT

MR. BENGE finished the chores, shut up the barns, and went into the house. From the table where she sat writing to her daughter, who was attending college, Mrs. Bengé could see the bobbing lantern coming towards the house. When her husband

says, Rose."

Mrs. Bengé quoted from "Life":

"Her sheets were down to a thread—bare three,
And her tablecloths were a sight to see.

She wanted scarfs and a towel rack,
And a good, plain, useful dressing sacque;
Some kitchen spoons, and a box for bread,

A pair of scissors and sewing thread.
She hoped some practical friend would stop,

And figure out that she needed a mop,
Or a bathroom rug, or a lacquered tray,

Or a few plain plates for every day."

"Tell your mistress to be serious, Jock, and say what she wants Santa Claus to bring her. The Santa Claus that comes to this house has to be told what to bring."

"No, he doesn't, Mrs. Bengé spoke quickly. "A man that can choose the lovely cups and saucers you gave me last Christmas doesn't need any help. I've often wished I had two dozen instead of one; and plates to match would have made our table perfect for our dinner party last week."

"Cups and saucers, and plates to match," Mr. Bengé chuckled to him-

THE CHRISTMAS SPIRIT

Over the world, with outspread wings,
The Spirit of Christmas broods and sings;
Of happy, hopeful, helpful things
All for you and me:

Charity, wide and deep and high,
Love, that reaches from earth to sky,
Peace, that close to heart doth lie—
All these gifts are free.

came in, a few seconds later, she called to him:

"This is December 1st. Sallie will be home three weeks from Tuesday—Christmas eve."

"Christmas eve? I thought she came the week before Christmas!"

"Well, she doesn't. But she has three weeks of vacation just the same, so it doesn't matter."

Unfortunately, it did matter to Mr. Bengé. Did not Sallie always tell him what to get for her mother's Christmas present? The fact that she managed so artfully that he always appeared to make his own choice did not change the matter. He knew and she knew that he counted on her help. What in the world could he get for his wife without Sallie's advice? He'd just write her to let him know at once what to do.

When Mrs. Bengé's letter went out next morning, Mr. Bengé supposed it carried a letter from him which read: "Dear Sallie: What in the world am I to get your mother for Christmas? Please write me at once. This leaves us both well. From your affectionate father." Not until the note slipped out from between the pages of his check book did he recall that he had failed to slip it in his wife's letter at the last minute as he had planned.

It was then the middle of the month. "Doesn't that beat all!" he exclaimed. "Now I can't possibly hear from Sallie—I must choose mother's present myself."

Outside the December wind howled fiercely. Mr. Bengé sat in the warm kitchen playing with the dog. "It's almost Christmas," he said. "Ask your mistress what she wants for a present, Jock," putting his hat on the animal's head as he spoke.

Jock gave a series of short, sharp barks.

"You'll have to interpret what he

self. Mother had given him a hint without meaning it. Those dishes were pretty; Sallie had good taste.

When he went to town next day, Mr. Bengé carried a saucer. The sooner he had his Christmas present for mother bought, the better. From store to store he went; the pattern was out of stock. The merchants were not even sure they could match it on order. He went home disappointed and cross. Confound it all! why didn't Sallie write him anyway?

He was still disgruntled when he sat down to read his papers. From one dropped a slip which read, "Your subscription has expired." Rose had often wished she took some of the popular women's magazines. Why not subscribe to some for her Christmas present when he renewed his subscription? He turned the pages for the clubbing list, marked the ones he would order, and leaned back at peace with the world. But his satisfaction over the solution of the Christmas gift problem was short lived. At the supper table Mrs. Bengé said:

"Elder Owens called today. He was taking subscriptions and renewals for all the leading periodicals. It seems that one of our church members turns in the subscription commissions to the mission fund, so of course I subscribed with him. I paid for them with my state fair premium money."

"Did you get the women's magazines you've been wanting?"

"Yes, three of them; but I wasn't really extravagant; the rates were low."

The days slipped by. Christmas was but a few days off, and Mr. Bengé was nearer a choice of a Christmas present—until a card dropped from Joe Brown's pocket when he took out his check book to pay for a load of corn, and Joe's explanation of the card gave Mr. Bengé a brilliant idea.

"I couldn't afford to lose that," Joe had said as he reached for the card, and opened the folder to display a holly bordered Christmas greeting, and ten fresh one dollar bills enclosed in an envelope, with the inscription, "Fresh from the mint, to do your bidding."

(Continued next week.)

CHRISTMAS CANDIES

Chocolate for Dipping Candies

Here is a hint worth remembering when you dip chocolates for Christmas candy: Either the plain or the sweet chocolate may be used. To prevent streaking or turning gray the chocolate must be melted at a low temperature, so fill the lower part of the double boiler with boiling water. Place top compartment in position, then put in the chocolate which has been cut fine. Add one tablespoon salad oil to each half pound. Stir frequently till chocolate melts, then dip in fondant centers, nuts or pieces of candied fruit. Place to dry on board which has been covered with oil cloth.

Fruit Candy

Put through food chopper $\frac{1}{4}$ pound coconut, $\frac{1}{2}$ pound seedless raisins, $\frac{1}{2}$ pound dates or figs, 1 pound shelled nuts. Add 2 tablespoons syrup, form in balls and oblongs.

Fondant

Boil without stirring 5 cups sugar, $2\frac{1}{2}$ cups water and $\frac{1}{2}$ teaspoon cream of tartar to soft ball stage (till it forms soft ball when dropped in cold water) or to 238 degrees Fahrenheit or 240 degrees on damp day or if to be used at once. It is of course much more satisfactory to test heat accurately with candy thermometer. Make swab by wrapping fork in piece of linen, dip in hot water and wipe crystals from sides of pan as soon as they form. This will prevent crystallization. Covering the pan the first ten minutes of cooking also tends to prevent formation of crystals. Remove from fire, let stand till cool, then beat till creamy. Turn out on large platter and knead till free from lumps and soft and velvety in texture. It is better after standing 24 hours in covered jar.

Chocolate Fondant

Add 3 ounces grated chocolate to above recipe.

Coffee Fondant

Make $1\frac{1}{2}$ cups strong coffee, strain and add 5 cups sugar and $\frac{1}{2}$ teaspoon cream of tartar and proceed as for plain fondant given above.

Cream Mints

Melt 1 pound fondant over hot water. Flavor with drops of either oil of peppermint, wintergreen, clove, cinnamon or orange. Color if desired. Drop from tip of teaspoon on oiled paper.

Chocolate Creams

Mould plain fondant in any shape desired. Let stand in cool place till firm. Lay each cream on fork, dip into chocolate made as directed in first paragraph.

Chocolate Circles

One-half cup walnut meats, $\frac{1}{2}$ cup figs, $\frac{1}{2}$ cup almond paste, grated rind one orange, $\frac{1}{4}$ teaspoon salt, 2 squares unsweetened chocolate, orange juice, sugar.

Put walnuts, figs and almond paste through food chopper, add orange rind, salt and enough orange juice to make mixture of consistency to handle. Knead on a board or marble slab. Sprinkle with sugar, cut in circles, brush with chocolate melted over hot water and decorate with walnut meats broken in quarters. Serves 36.

Glaze Walnuts

Two cups sugar, 1 cup boiling water, $\frac{1}{3}$ teaspoon cream of tartar, 3 cups whole Diamond walnut meats.

Put sugar, water and cream of tartar in a smooth saucepan; stir, place on range, and heat to boiling point. Wash off sugar which adheres to sides of saucepan with a butter brush dipped in cold water, and boil without stirring to 310 degrees Fahrenheit, or until syrup begins to discolor. Remove saucepan at once from fire and place in a larger pan of cold water to instantly stop boiling. Remove from

cold water and place in a saucepan of hot water. Take whole walnut meats separately on long pins or steel skewers, or with a small pair of tweezers, dip in syrup to cover, remove from syrup and place on a tin sheet. Makes $1\frac{1}{2}$ pounds.

Chocolate Walnut Caramels

One cup sugar, $\frac{1}{2}$ cup white corn syrup, $1\frac{1}{2}$ cups boiling water, 1 teaspoon vanilla, $\frac{1}{3}$ cup powdered whole milk, 3 squares chocolate, 1 cup walnut meats.

Put sugar, corn syrup and water in saucepan, stir until sugar is dissolved, bring to boiling point and boil until mixture will form a very firm ball when tried in cold water. The caramels when cold will be of the same consistency as this firm ball. Do not beat, as beating may cause the candy to become granular. Add vanilla, powdered milk sifted, chocolate grated and walnut meats cut in large pieces. Pour caramel into a buttered pan seven inches square. When cool cut in squares and if desired wrap in wax paper.

One and one-half cups cream may be used instead of boiling water and powdered milk. Makes 1 pound 3 ounces.

MINCE PIE

Mince Meat. 2 pounds chopped meat, 1 pound suet, 3 pounds raisins, 3 pounds currants, $2\frac{1}{2}$ pounds brown sugar, $1\frac{1}{3}$ cups molasses, 3 quarts chopped apples, 1 quart meat liquor, 2 tablespoons salt, 3 tablespoons cinnamon, 2 teaspoons mace, 2 teaspoons powdered cloves, 4 lemons (grated rind and juice), 1 quarter citron shredded fine.

Cook about $2\frac{1}{2}$ pounds round, flank or shoulder beef in $1\frac{1}{2}$ quarts water till tender, saving liquor. Chop or grind meat fine, being careful to remove all gristle. If meat is very fat use less suet. Mix ingredients in order given and cook slowly until fruit is tender. When done add 1 quart sweet cider. Store in stone jars in cool place. Add more cider when using if it is not sufficiently moist. Half glasses of jelly, syrup from pickled peaches, bits of preserves, etc., may be added.

CANDY BAGS

When making candy bags for Christmas trees line each one with paraffine paper. The lining will stitch on the sewing machine with the net, and the candy will be much more palatable for the extra care taken.

HOUSEHOLD QUERIES

Baked Oranges—Sweet Potato Pie

I have a friend visiting me from the East who says she was told by other visitors to California that the baked oranges they got out here were delicious. I never heard of them. Could you tell me about how they are fixed? Also, she spoke of the sweet potato pie that an old darkey cook used to make. Could any of the Cultivator readers give me that recipe?—Subscriber, Pomona.

Baked Oranges. Baked oranges surely are delicious, especially as an accompaniment to hot roasts. Perhaps it is because they seem so perfect just from the tree that we seldom think of cooking them. Cut off tops of as many oranges as you wish to prepare. Loosen flesh from rind by running grapefruit knife around. Place in baking pan and pour in water to come half way up the oranges. Boil until skins can be pierced with fork, then place a teaspoon or tablespoon of sugar in each according to sweetness of fruit, and a bit of butter. Bake till slightly browned. Serve hot or cold. Pour over a sauce made by boiling down liquid in pan, thickened slightly, if preferred, with corn starch.

Sweet Potato Pie. Boil or steam sweet potatoes till done. Line deep pie pan with paste and bake, but do not brown. Skin sweet potatoes and slice thin. Make syrup of two tablespoons butter, one cup brown sugar, one-fourth cup water and one teaspoon ground allspice. Put layer of sliced sweet potatoes on cooked crust, pour some of the syrup over, add another layer of sliced sweet potato and the

rest of the syrup. If your conscience will allow, dot bits of butter over top. Put on top crust and bake.

We have also tasted a most delicious sweet potato pie in which the sweet potato was forced through sieve or

mashed and made into custard. Can any of our readers tell us how?

Curing Olives in Salt

I understand that the Greeks in this country cure olives just in salt,

REMEMBER to ask your grocer for Calumet Baking Powder and be sure that you get it—the Indian head on the orange label. Then forget about bake day failures. For you will never have any. Calumet always produces the sweetest and most palatable foods. And now remember, you always use less than of most other brands because it possesses greater leavening strength.

Now Remember—
Always Use

**CALUMET
BAKING POWDER**

There is no waste. If a recipe calls for one egg—two cups of flour—half a cup of milk—that's all you use. You never have to re-bake.

Contains only such ingredients as have been officially approved by U. S. Food Authorities, is the product of the largest, most modern and sanitary Baking Powder Factories in existence.

Pound can of Calumet contains full 16 oz. Some baking powders come in 12 oz. instead of 16 oz. cans. Be sure you get a pound when you want it.

Calumet Columbia Muffin

Recipe

—4 cups sifted flour, 4 level teaspoons Calumet Baking Powder, 1 tablespoon sugar, 1 teaspoon salt, 2 eggs, 2 cups of sweet milk. Then mix in the regular way.

THE Martin
O.D. & G. CO. REGISTERED
WAY

For Ditching Supremacy

The name MARTIN on your ditcher is a guarantee that ditching troubles are over. Thousands of farmer users in every state will tell you this.

For Horse or Tractor Use

Made of steel throughout, to last a lifetime. Now equipped with latest improved reversible and adjustable features. Made in four sizes, for horse or tractor. Pays for itself in two days' use.

Every Farm or Ranch Needs a "Martin"

—because it makes new ditches or cleans old ones; it grades roads, builds trails, makes levees and terraces. Saves hundreds of dollars a year in labor alone. Write for free book on ditching with the MARTIN. It is full of facts that you should know. Address

leaving them dry. Can you tell me
how it is done?—Subscriber.

Here is the method given to the
Cultivator by George C. Roeding: Bore
a hole about one inch in diameter near
bottom of barrel, place couple of
inches of salt over bottom of barrel,
then a layer of three inches of olives,
alternating layers of salt and olives
until barrel is about three-fourths full.
Every two or three days pour from
two to three gallons of water over
olives, letting it run out through the
hole slowly. Within a month the
olives will begin to shrivel. Remove
from barrel and place olives that were
on top at bottom of barrel, redis-
tributing the salt evenly through the
barrel and continue pouring water
through them about every five days.
After bitterness is practically all out
of the olives their flavor may be very
materially improved by pouring a little
olive oil over them in a shallow vessel,
rolling gently about until each fruit
is covered with a thin film of oil. If
it is desired to keep the olives for a
year or more a small sprinkling of salt
on them is all that is necessary. Fully
ripe olives should be used.

Green Tomato Pickle

I have a lot of small green tomatoes
left on my vines, which seem not to
ripen up. Would these be good for
what is called green tomato pickle?
If so, can you tell me how to make it?
—Subscriber, Tropic.

One gallon green tomatoes, 6 large
onions, 3 cups brown sugar, ½ lemon,
3 red peppers, 3 cups vinegar, 1 table-
spoon each whole black pepper, whole
cloves, whole allspice, crushed celery
seed, mustard seed, ground mustard.
Slice tomatoes thinly, sprinkle with
half cup salt and let stand over night
in earthen or enameled vessel. In
morning drain well. Tie pepper,
cloves, allspice and celery seed in
cheesecloth bag. Slice onions and
lemons thinly and chop pepper pods
very fine. Put vinegar, sugar, spices
in large kettle, add sliced onions,
lemon and drained tomato. Cook half
hour, stirring gently to prevent burn-
ing. Remove bag of spices. Pack hot
in jars, place covers and rubbers on
jars loosely, boil 15 minutes and seal.

Potassium Permanganate for Poison Oak

In your issue of November 27 under
Household Department you give a
treatment for poison oak. There is a
specific for poison oak which, although
not generally known as such, is as
sure in its results as other recognized
specifics for other diseases. A solu-
tion (about 3 per cent) of perman-
ganate of potash rubbed on the affect-
ed part will instantly remove all itch-
ing and inflammation and will speed-
ily effect a cure. It should be reap-
plied as soon as the itching returns.
The stain caused by this chemical
wears off reasonably soon, and if it
is desired to remove it immediately
this may be done by the application of
another chemical of which I have for-
gotten the name but which any drug-
gist can supply. I put this solution
on my face without hesitation, pre-
ferring the temporary complexion of
an Indian to the suffering which poison
oak causes.—R. W. Bates, Carpinteria.

Fruit Cake

You published a number of fruit
cake recipes a few years ago, I think
it was in 1916. I lost my paper while
we were repairing the house. Could
you reprint them or send them with
the patterns if you have them? The
one by Mrs. John Bennefield was es-
pecially good.—Subscriber, Lemoore.

We are sending to our subscriber
copy of the Cultivator of November
18, 1916, which has 29 recipes for
Christmas cakes and puddings, con-
tributed by Cultivator cooks. We wish
we might have space to reprint them
all, but since that is impossible we
will give the one which she speaks
of as liking particularly well.

This is excellent if properly made
and baked. I have used it for years
and many of my friends and neighbors
have adopted the recipe: Two pounds
raisins, ¼ pound citron, 1 pint brown
sugar, 1 pound figs, 1 pound dates, 1
bowl chopped walnuts, 1 nutmeg, 1
tablespoon cinnamon, ¼ tablespoon
cloves, 4 eggs, 1 cup butter, 4 cups
flour and 1½ teaspoons soda sifted
three or four times, 1 cup sour milk.

Mix fruit, spices, nuts and flour thor-
oughly together. Rub butter and su-
gar to a cream. Add the eggs well
beaten and the sour milk, then add
the dry ingredients previously well
mixed to the butter, sugar, milk and
eggs. Have pan previously prepared
as follows: Fit three papers carefull-
ly, grease thoroughly, make a paste
of equal parts graham and fine flour,
wet with water just stiff enough to
spread easily with a spoon. Place the
first paper in the pan with the greased
side down and spread the paste evenly
over the paper, both bottom and sides,
press the second paper carefully into
its place with the greased side up and
next put in the third paper as you
would into any baking pan, and put
in the cake. Bake in round tube pan
all in one cake. Bake about three
hours in very moderate oven, placing
paper over top to prevent browning
until cake is nearly done.—Mrs. J. C.
Bennefield, Santa Paula.

Keeping Poinsettias

How can I keep poinsettias after
they are cut from the plant? As soon
as I bring them in they wilt.—Sub-
scriber, Padelford.

Pick the poinsettias in the early
morning while they are full of sap,
place stems immediately in vessel con-
taining four or five inches of boiling
hot water. Let stand until water
cools. They will then keep for sev-
eral days. Dahlias or even heliotrope
may be kept for a long time if treated
in this way. It will also be found
well to give roses and violets and
other better keeping flowers this same
treatment if they are to be carried
out of water for some time. Perhaps
it is not universally known that vio-
lets that have been worn and wilted
to rags may be renewed by clipping
stems and putting in boiling water,
leaving till it is cool.

Soft Soap Making

Perusing the fourth edition of
"Farm Questions Answered," on Page
149, subject "Soft Soap," I find the
recipe not so clear as my experience
was when a boy back in New York
state making ash packs in barrels for
obtaining lye. A standard salt barrel
of 280 pounds was considered about
an ideal leaching tank. Holes were
made with an inch auger in the bot-
tom in sufficient number to allow a
free flow of the lye; when the barrel
was positioned sticks of wood about
three-quarters of an inch square, and
long enough to reach across the barrel
head, were placed in the barrel first.
Two layers of sticks were used, the
second layer crossing the first, then
enough straw placed on top of the
sticks to keep the ashes from running
through with the lye, well kept dry
ashes, not necessarily new, but hard
wood ashes, beach, birch or maple,
were tamped in the barrel until full,
leaving only room enough on top to
hold not more than six quarts of
water. Water should be kept con-
stantly on the leach to insure a steady
flow of lye. Enough lye should be
added to the lard, grease, scraps of
fat meat and such like waste to eat
or disintegrate the fatty material,
which it will do if strong enough. The
material in the coudron is stirred at
least once per day after enough lye
has been added to allow it. When
the fat is nearly eaten up a light fire
is applied to bring the mess to a boil-
ing heat. Stir it well and allow it to
cool off. By inspection when cooled
you can determine whether the grease
and scrap are well disintegrated and
mixed; also whether the soap is too
thick or too thin. If thin, heat it up
again to evaporate sufficient water re-
maining to make it the proper stiff-
ness. If too thick, add more water
or weak lye and reheat. If scrap is
not quite all disintegrated add a little
more lye and reheat. One must be
careful not to get too much strong
lye. In this case, to remedy, more
fatty matter must be added. If this is
not done the soap will eat the user's
hands. Any change must be followed
by a reheating and good stirring. The
desired thickness depends upon the
choice of persons. Too thick soap
wastes in the use of it. Too thin soap
is less effective. My mother thoroughly
understood the art of soft soap
making. As she had no girls and I was
the youngest boy I was forced to learn
these two arts to perfection.—E. M. Knollin, Hayward.

MEN WANTED TO LEARN AUTOS & TRACTORS IN LOS ANGELES

Men of any age with no prev-
ious experience can learn
auto and tractor business in
few weeks. Earn Big Money
as repairman, tractor expert,
or go into business for your-
self. We help our graduates
get started. Only school in
America giving advanced
auto-electrical training and
actual garage and repair shop
practice. All year 'round
tractor field work. Training
includes tire repairing, machine
shop, driving and repairing all
makes of autos, tractors and
gas engines. Earn board and
room while learning. Success
assured. Jobs waiting. Write
NOW for FREE book of facts
telling about your chances in
this business. Tells about men
from your home town who are
successful National graduates.

Sulphur as a Fertilizer

INFORMATION concerning the relation of sulphur to plant nutrition and growth has been accumulating during the last decade, and the mass of data has now become so important that it demands recognition of all investigators of nutritional problems. Indeed, it seems to me that much of our past experimental field work dealing with the influence of fertilizer elements upon plants has been so loosely done that we are under the necessity of reexamining the whole matter, says a writer in Science.

Although the value of sulphur, particularly in the form of gypsum, was recognized at an early period in our national history, the lack of uniform success with it soon led to its neglect as an important fertilizer. And after the invention of acid phosphate about the middle of the last century, the development was almost wholly toward soluble fertilizers containing nitrogen, phosphorus and potassium. Sulphur was not included as a part of a complete fertilizer, although it was recognized as necessary to plant growth. The soil was thought to contain enough sulphur, and plants to need so little of it that it was added to the soil only incidentally, as in acid phosphate, potassium sulphate or ammonium sulphate, along with the three elements forming the so-called "complete" fertilizer.

Experiment station workers and other students of mineral nutrition of plants fell into loose ways of working with fertilizer salts. They have not hesitated to use sulphur-containing nitrogenous compounds when testing the influence of increased nitrogen on plant growth. Similarly, the acid phosphate has been used in testing the effects of phosphorus, and potassium sulphate has been used when potassium was under observation. In comparing various forms of fertilizer elements we find the superphosphate, for instance, pitted against bone meal, or potassium sulphate against potassium chloride, or ammonium sulphate against sodium nitrate as a source of nitrogen. It is evident that such tests as these are all invalid if sulphur itself is shown to be an important fertilizer element. For the experiments have at least two variables, and it would be impossible to ascribe differences in growth to one element with any certainty that the other element was not partly responsible for the result. The recent facts brought out in regard to sulphur should lead at once to a widespread reexamination of these problems, with more rigidly designed and controlled experimentation.

The basic facts brought out are briefly summarized here. In the first place, soil studies have shown that sulphur is one of the rare necessary elements. Soils are generally no richer in sulphur than in the fertilizer elements, nitrogen, phosphorus and potassium. This scarcity of sulphur in normal soils is probably related to the ready leaching of sulphur into drainage water. At the same time, improved analytical methods have demonstrated that crop plants require more sulphur than was formerly supposed. They remove it from the soil fully as rapidly as they remove any of the other elements which may become limiting factors. The normal sulphur content of soils is sufficient for from 15 to 70 crops, provided there are no additions from outside sources, as from rainfall. Even if we count in the rainfall sulphur, it is probable that sulphur is just as often a limiting factor as is phosphorus, or nitrogen, or potassium. For two of the last named elements do not leach as readily as sulphur. The important point is this: If sulphur is a limiting factor, addition of any other fertilizer is useless, and a waste, just as much as would be the use of gypsum as a fertilizer if phosphorus were the limiting factor.

Instead of thinking of the N. P. K. formula as representing a "complete" fertilizer, it is time we began work solely from the standpoint of limiting factors, including not only these three, but sulphur, calcium, magnesium and any other factors which influence crop production. The early failures with gypsum were probably due to the fact that phosphorus or some other ele-

ment besides sulphur was limiting growth, or that sulphur at any rate was not the thing needed. These remarks must not be construed as argument for the discontinuance of any of the fertilizer elements now in common use. It would be a grave error to try to replace them with sulphur when they are deficient, but we can no longer ignore sulphur as one of the very important fertilizer elements.

Since the Cruciferae and Leguminosae are known to use quantities of sulphur in their metabolism, crop plants of these families must be the ones most likely to suffer from deficiency of sulphur. Recent work by Reimer at the Oregon agricultural experiment station is very significant and deserves

the attention of agriculturists and scientists all over the country. He has found that many of the soils of Oregon are deficient in sulphur, and that addition of sulphur-containing compounds of almost any kind may lead to very remarkable increases in the yield of alfalfa or clovers upon such soils. His experiments extended over several years and involved a variety of soils. The increased production ran from 50 to 1,000 per cent in alfalfa with application of such sulphur-containing materials as gypsum, sulphate, flowers of sulphur, etc. Addition of phosphorus without sulphur had practically no effect, showing that the acid phosphate was valuable only for its sulphur content in this case. The possibility of such increases is a challenge to agriculturists everywhere in these times of underproduction.

The best results seem to come when

the sulphur is used as a top dressing on the legume crop. The usual custom in the United States is to fertilize the cereals, wheat, etc., and allow the legumes to get the effects a year or two later. Sulphur applied in this way does the legume crop little good, for most of it disappears out of the soil by leaching before the legume comes in the rotation. The early successes were most notable when application of the sulphur fertilizer was made directly to the crops most needing it, the legumes. These convert the sulphur into the organic form, and if used as green or stable manures, provide sulphur for succeeding crops in a non-leaching form. It seems quite clear that we are applying our sulphur fertilizers at the wrong place in the rotation when we use them with the cereal grains, which require little sul-

(Continued on Page 811.)

REPUTATION

The Best Tracklayer Sixty Tractor has built a reputation for stamina, reliable power and low up-keep. This reputation so closely guarded by the manufacturer has been due to the quality of material used, the proven design and the knowledge of tractor requirements which has been gained through years of experience in the actual building of tractors and the incorporating of modern improvements in each new model.

The "Sixty" was too powerful for all uses; so, upon the demand of farmer, orchardist, contractor, in fact all lines of industry where tractors are employed, the factory has perfected a model to be known as the Best Tracklayer Thirty Tractor, in which has been incorporated all of the experience of the manufacturer as to design, etc., together with all of the reliable improvements of the age. The "Thirty" is years ahead of any other tractor on the market.

*Delivery date on this new model "Thirty"

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unaligned communications receive no attention.

Gum Disease

We have from Dr. R. R. Snowden letter which he has just received from a Porterville orange grower, referring to beneficial results of treating gummosis by removing all diseased bark down to clear wood, then disinfecting and coating wound with salicylic acid, half drachm, pine tar half ounce, shellac varnish one quart, given in article by Dr. Snowden in the Cultivator of November 23, 1918. The writer asks if anything better has been found, and continues: "I am again in trouble, for my trees have not been irrigated correctly and so have a white mold around the trunk below the soil. Today I exposed the trunks of 150 trees, scraped as I would for scaly bark and treated the crown roots and the diseased bark with your formula. Did I do the right thing? I have just put on 15 tons of stable manure to the acre, have fumigated and shall soon prune. Have plowed one way and if it doesn't rain we shall finish plowing in about ten days. Would you dig well around the trees to try to eradicate what must be a serious trouble, for the mold surely extends below where I can see? My trees look unusually well, though I had almost no crop this year. Now I see why.

Dr. Snowden answers: "I know of no better treatment for the trees that have failed to recover than that already applied. The bark should be scraped a little farther around the diseased parts and a new application of the same remedy made after the scraped parts are dried. It was a mistake to scrape away the bark for the white mold noticed on the base of the trunk, as that could have been readily destroyed by whitewashing trunk and root crown. Both of these troubles and many others of citrus trees in California are due to bad planting. Citrus trees should be planted with the root crowns at the surface of the ground, just as all trees grow in the forest. They would be more resistant to all kinds of trouble than when weakened by such unnatural planting. If the roots are affected by the mold the soil needs lime and the kind to use is thoroughly air slaked lime.

Persimmon Seeds

Please tell me how best to germinate persimmon seeds, when should they be planted and how long will it take them to come up?—Subscriber, Orange.

Seeds should be planted at once and will probably show through ground about May. It is best to stratify them first, in a box of fine sand or soil retentive of moisture; they should not dry out. Leave in strata for 60 days or until seeds become plump. Even if starting to sprout no harm is done if they are kept moist. Then plow furrow and plant in nursery row or in field where they are to be budded if you so choose. Seeds may be planted direct in nursery row but it would involve months of care and weeding, which is more easily done in compact form.—E. B.

Stock Laws

Has there been a state law passed during the last year which would affect running stock in San Diego County?—Subscriber, Ramona.

We are not informed as to any ordinance which may have been passed by the San Diego County board of supervisors but there has been no state law passed within the last year. There will probably be changes made at the coming session of the state legislature which convenes in January.

Dip for Potatoes

Will you please tell me how much water to use for each pound of corrosive sublimate when used for dipping potatoes? Also how much for each ten sacks of potatoes?—Subscriber.

The proportions in mixing this dip for potatoes are corrosive sublimate,

one ounce; water, six gallons. Immerse whole tubers for one and one-half hours and be sure to plant in disease free soil.

Peach Tree Borer

The department of agriculture recently sent us a bit of copy regarding determinations of the department as to para-dichlorobenzene treatment for peach borer. Our readers have seemed to find it impossible to secure this material, and we have tried one of the largest drug and chemical houses on the coast and they have never heard of it, hence we are asking Washington regarding this substance which it asserts is used very largely in the Georgia peach belt.

Walnut Variety

Can you tell me the trouble with a walnut tree not bearing?—I have a row of 20 trees set 40 feet apart along an irrigation ditch, ten feet from ditch. The trees are 12 years old and all bear well except the last one on the west end of row, and this tree has a good crop of large nuts, but they have little or no meat or kernel in them, and what there is is black and dried up. What can be done, if anything, to remedy the defect?—Subscriber, Modesto.

This is plainly an unproductive tree and the sooner it is grafted over the better, this providing the root and tree generally are in good healthy condition. Select grafts from known bearing quality tree which produces desirable type of nut.

Cheap Paint

I desire to paint my farm buildings, but the cost of labor is prohibitive at this time, although I have the materials on hand. If possible will you kindly advise me if there is an inexpensive spray outfit on the market for paint or stain? I have known of painters using a spray to do a quick job. I enjoy your paper greatly and read it every week.—Subscriber, Thermal.

The Cultivator has given several cheap paint mixtures ranging all the way from skim milk and cement up, but at the present time linseed oil is coming back to a reasonable price and we imagine a paint with liberal quantity of linseed oil would be one of the cheapest in a period of years. As to spray pump, the ordinary pump as used in orchard work has been employed, and most successfully, in the application of paints and whitewashes, especially whitewash in the interior of barns and warehouses. If care is taken in straining the paint through fine wire sieve the pump works as well as it does with ordinary sprays as applied to trees and the application of paint is made much more economically.

De-eared Rabbits

I have two Belgian hares that were born without ears. There is a hole on each side of their heads, but no sign of projecting ears like rabbits should have. Do you think catching the doe by the ears before the rabbits were born would have anything to do with it? The rabbits are now four weeks old and very lively. Their fur also seems to be so much softer and finer than the other rabbits I have. Both rabbits have a face something like an owl. I suppose, though, it is because they have no ears.

We think the California Cultivator a very good paper and find many interesting and helpful hints in it.—Barry E. Girling, Modesto.

We fail to see the advantage, or otherwise, of this type of rabbits, but going on the assumption that like breeds like, we would think some interesting experiments could be carried on with these freaks.

AFTER WEED PESTS

The meeting of the horticultural commissioners at Fresno resulted in determination to more effectively control and restrict the spread of the various weed pests of the state. The committee chosen at that time to formulate plans for an effective campaign has selected Harry P. Stabler, chairman, and H. M. Kingwill, secretary.

Cattlemen to Try New Market Plan

By R. P. Royce

SEVERAL hundred of the leading cattlemen of California met in annual convention of the California Cattlemen's Association in San Francisco, December 11, and adopted a plan for stabilizing their markets that is at once a new departure and a plan full of possibilities. Indeed, it is generally believed that the proposed plan constitutes the first constructive suggestion that has developed from any similar convention. It has long been recognized that the prime problem of the California cattle producer was one of markets. Being far removed from the center of the cattle trade and lacking any semblance of an organized market such as Eastern producers have, they have faced a peculiar set of conditions that were most unsatisfactory. The association was organized with the idea of correcting many of the faults of our marketing system, but it appeared from the outside that slight progress was being made. Now comes this new plan that may prove to be extremely useful—at least it was received with enthusiasm and is to be given a trial. The plan is largely credited to Fred H. Bixby, who has been president of the association for the past two years, but it received the endorsement of the marketing committee of which C. N. Hawkins was chairman.

In brief, the plan proposes to stabilize the coast market by controlling the surplus, it being agreed by all that control of the surplus will control the market. In California we have two periods that register a surplus of cattle above our consumptive needs. There is a spring surplus in May or June when Southern cattle come off grass and a fall surplus when the Northern cattle are fat. With the exception of a small number of South Texas cattle no other cattle are fat enough to compete with our fat stuff in May. Consequently it is known that the May and June market in the East is fairly good. Now if all these fat cattle are sent to the Coast killers the surplus is sufficient to break the market. In the past but few producers have had the nerve to ship out of the state to Eastern markets for the reason that they have been afraid to take the chance of consigning their cattle to an open market. The association now plans to raise "a guarantee fund" of \$250,000. This fund will be raised by personal notes from the cattlemen themselves. The fund will exist as notes, no cash being collected, and these notes will be deposited with a bank as collateral for loans to be made to the association for the carrying out of their plan of marketing. Once having secured this fund—and it is said to be certain that the amount will be raised—a committee will be appointed to supervise the marketing. This committee will be made up of recognized and conservative experts. It will be their duty to assemble accurate data on the entire cattle industry of the West; to know the probable supplies; the condition of feed; the approximate time the cattle will be ready to market, and the market situation on all of the principal markets of the country for the various classes of grass cattle. With these data in hand, and with complete information as to the actual cattle situation in California, the committee will be empowered to enter into contract with any California producer, who has top fat steers, to ship his steers out of the state on the following plan: The cattle will be carefully graded and the owner will be guaranteed against loss, that is, he will be guaranteed the price that the committee has agreed is fair at the time. For example, if the committee finds that the Eastern price for cattle of that grade is, say, eight cents per pound and that it will cost two cents per pound to ship, the owner will be advised that his cattle are worth six cents in California. If the coast packers will not pay that price, or even if they will, the owner can enter into agreement with the committee and ship his cattle out of the state. If his cattle fail to bring the price determined upon, the committee representing the California Cattlemen's Association will remit him the amount

of his loss. This money will be secured from a bank through the use of the guarantee fund. If at the end of the fiscal year there has been created a deficit in the fund, the members of the association agreed to pro rate the loss among themselves. Such action will amount to this: Instead of the individual contracting a loss in an effort to relieve the glut on the local market and thereby act to hold up the coast market for the benefit of the many, the cattlemen as a whole will absorb the loss. It was declared that expert cattlemen do not contemplate a loss in any one year. There is another point in the plan that is of interest. When an individual contracts with the committee to ship his cattle out of the state and a profit is made by reason of his cattle selling for more than the guaranteed price, 50 per cent of the profit will go to the association and be credited to the guarantee fund. It was stated that the association expected to eventually

create a cash guarantee fund through such profits.

In presenting the report of the marketing committee, Chairman Hawkins declared that the cattlemen of this state had been saved an amount of money difficult to estimate. He declared that all during the past season, and at the present time, this state enjoyed the highest market for grass cattle of any state in the Union, and he attributed it to the fact that the association had early taken steps to hold up the market by shipping cattle out of the state. Hawkins said that cattle that are worth ten cents on our coast markets are only fetching seven to eight and one-half cents on other markets. He further asserted that last May the stage was all set by the killers to break the coast markets and that they were forestalled when several thousand cattle were sent out of the state and it became evident that thousands of others would be shipped if the price was not fair. He gave \$5,000,000 as a conservative estimate of the amount of money saved California cattlemen by following the plan of shipping East. These figures are based on the assumption that 500,000 cattle have been marketed in this

state, since May, at \$9 to \$10 per head more than the packers expected to pay.

In referring to proposed plan of marketing, Hawkins gave it as his opinion that the packers were inclined to play fair with the cattlemen.

Other features of the meeting were addresses by Dr. David P. Barrows, president of the University of California; Mr. William Sproule, president of the Southern Pacific Company; Professors W. R. Camp and P. B. Kennedy of the University of California and Paul G. Reddington of the United States forest service.

Several changes in the by-laws of the association were agreed upon.

During the meeting the members raised a fund of over \$13,000 to clear up the indebtedness of the association. O. B. Fuller of Los Angeles was master of ceremonies and demonstrated his ability to "get the money."

T. H. Ramsay of Red Bluff was elected president to succeed Fred H. Bixby.

A banquet was held at the Palace Hotel following the meeting.

For Steady Power

Every farmer knows that a horse can't pull a load by jerking on the traces. There must be a steady, even pull or the load won't move.

Engines—like horses—must pull evenly or they won't work properly. Jerky operation—due to poor ignition—reduces the power of an engine. More than that—it wears the engine out.

Whether your gas engine drives a house lighting plant, the yard pump, or a big tractor, you need the full, hot, unfailing sparks of a Bosch Magneto to prevent misfiring. They fire all the gas in the cylinders—every time—and develop maximum power, economy and dependability in the engine. Four million users will readily testify to that.

UNITED STATES CREAM SEPARATOR
WITH PERFECTED DISC BOWL

World's Record Skimming

Interchangeable Discs
Easy bowl to clean

Do YOU Value Ease of Cleaning?

Morning and evening—365 days a year—the same process. Maybe it has sometimes seemed to you the milk-separation was mostly "washing-up."

The wash-up is one of the problems solved for you by the United States perfected disc bowl. No fussing with numbered discs to waste your time and try your patience. Washing and rinsing the interchangeable discs is done in a jiffy, and your separator is ready for the next run. It is characteristic of United States precision that this marvelous easy-running bowl has been attained with interchangeable discs.

At every turn the United States meets you more than half way in labor-saving.

OBTAINING A START WITH PUREBREDS

There are thousands of farmers all over the United States who are breeding scrub cattle which, if the cost of feed, pasture and labor incidental to their keep were figured, would show considerable loss. When these same farmers are approached and efforts made to interest them in the purebred business, they state that it takes too much capital to start. The same argument will apply to anyone wishing to start farming or any other line of business. The successful man of the twentieth century is he who has more energy, initiative and courage than his neighbors.

In almost every section of the United States there are local associations of breeders of the various breeds of livestock which are formed for the purpose of encouraging and assisting other breeders of the same stock. Most of these associations conduct sales and otherwise assist in the disposal of the surplus stock.

Almost all of the larger breeders started in a small way with the purchase of a few head. What may be accomplished in a short time is well illustrated by the following facts related by Professor E. L. Potter of the Oregon agricultural college. In 1914 \$2,500 was appropriated by the officials of the college to purchase a few purebred Hereford cattle to form the nucleus of a herd. The college was growing and a herd became necessary for the instruction of the students. The amount appropriated was not much, but Professor Potter was determined to make the best of what he had available and with these funds purchased eight head, seven females and one bull. This spring a representative of the Hereford association visited the college and found a herd of 25 beautiful females and the herd bull. Not another female has been purchased, the entire herd having been built up from the original eight head. They not only have this beautiful herd, but have sold \$5,000 worth of cattle out of the herd in the past six years, thus double the original investment has been realized in sales, and more than three times the original number of cattle purchased remain on the college farm.

This instance cited is not exceptional, in fact, almost every breeder of purebred stock has had practically the same experience. It is true that it would cost more to start now than it did six or ten years ago, but the progeny are worth more than they were in those times also. Two or three or a dozen head may be purchased and handled practically the same as other cattle on the farm and it will be found that the purebreds require less feed than the scrubs. Take care of the calves, grow them out in good shape, and you will have no need to worry about the sale of them.

With the farm bureau, county agent, fieldman and local associations helping to develop better farming methods and better livestock in your community, you may rest assured that if proper attention is paid to the development of the young stuff, ample returns will be forthcoming.

NEW DEVELOPMENT OF COW TESTING ASSOCIATIONS IN THE WEST

It has been felt for some time that many men were not getting enough out of cow testing association work here in the West, and in order to bring to every man the full benefit of being in an association the western office of the dairy division has been urging organization along the following lines:

An association of from 300 to 600 cows in about 25 herds; charging enough per cow to enable the employment of a man as tester, who is in reality a dairy specialist.

Payment of all money in advance, or giving bankable promissory notes to cover all payments.

The association to be a department of the farm bureau or a farm bureau project, so that the county agent will have supervision over the tester and the affairs of the association.

The function of the association to be in the main: Culling of unprofitable cows; teaching of scientific dairy feeding and dairy management; foster-

ing of better breeding and better care of young stock.

Several new associations have been organized on this basis and two are worthy of special mention, viz., the Bonner County, Idaho, Cow Testing Association and the Sacramento-Yolo Farm Bureau Cow Testing Department of Sacramento.

The Sacramento-Yolo association was organized in October, 1920, and 600 cows were signed up at \$4 per cow, which gives the association \$2,400 per annum for operating expenses. Every member of the association gave

Your Private Cow Doctor

If cows could tell their feelings, many a serious illness would be prevented, and constant milk losses would be saved.

Milking cows, particularly, are subject to many ailments that are first manifested only in a reduced milk yield.

Such cow ills you can treat yourself with the aid of Kow-Kare, the great cow medicine. At the first sign of reduced milk flow try Kow-Kare. Use it according to directions and watch the story the milk pail tells.

Dairymen everywhere know the value of Kow-Kare both in preventing disease, and in treating such ailments as Barrenness, Abortion, Retained Afterbirth, Scouring, Lost Appetite, Bunches.

No cow barn should be without Kow-Kare, your private cow doctor. Sold in 70c and \$1.40 packages by feed dealers, general stores and druggists.

Write for free book, "The Home Cow Doctor."

NEVADA HEREFORD RANCH

We always carry a large herd of high-class Herefords and at the present time we are offering:

A splendid lot of young cows with Harris Standard 2nd calves at foot, and many of them rebred.

A nice selection of young cows and helpers bred to our herd bulls.

A choice collection of open heifers.

A lot of good rugged range bulls. These are the real money making kind, and they are priced to make money for the buyers. We will sell them in car lots or in lots to suit buyers.

We also have some choice young bulls of herd-header caliber that we will sell well worth the money.

We invite your inspection.

four bankable promissory notes to cover the quarterly payments. Carol Stone is the dairy specialist employed as tester and he will test the cows and figure out the profits from each individual cow. He will also instruct the farmers as to the proper method of feeding and advise them on their dairy problems. Mr. Stone has had nine years of practical dairy experience as well as technical training.

The Bonner County association was organized along the same lines except that only 200 cows were signed up in 25 herds and the rate was over \$8 per cow. This association was started in September, 1920, and already some of the farmers say that they have secured their money's worth from it and other men are wanting to join. The specialist employed in this association is Matthew Resendes, who has had many years of dairy experience as well as seven years in cow testing association work. It has been said of

this association that the farmers did not have time to go to college but the college was brought to them.

These two associations should set the example for the rest of the West as they are bound to be a success as they aim at teaching men to be good dairymen while at the same time they improve their herds.

The rate per cow charged in these associations may seem excessive to some but it is necessary in order to secure the services of such men as testers, and besides it has been proved over and over again that even where the tester does nothing but test the cows that returns run from \$15 to \$50 per cow, while the return from these new associations should be much greater and more permanent, both to the individual and to the community. —C. V. Castle.

GOOD LIVESTOCK FARMING MEANS GOOD CITIZENSHIP

In a message to the directors and members of the Wisconsin Livestock Breeders Association, Andrew W. Hopkins, until recently its secretary, makes the following statement: "It truly is a noteworthy fact that where livestock farming has attained a high standard of perfection there also has citizenship attained an equally high standard. An intelligent contact with farm animals always has and always will insure a quality in the man; and a closer kinship with the better types surely brings forth fruits not yet compassed. General education, honesty of purpose, righteous living, culture and religion have made the most progress in those communities in which intelligent stock farming has been most generally pursued."

The United States department of agriculture has received a copy of Mr. Hopkins' recommendation for the future development of the livestock industry. These point out that stockmen may well seek to increase their returns from livestock: by discarding inferior animals; by strengthening their organizations; by cooperating when necessary in buying and selling; by combating disease; by supporting boys' and girls' club work; by studying livestock and milk marketing; by insisting upon more stabilized markets; by working for the proper relation between the price paid the producer and that paid by the consumer.

BULL ASSOCIATION PROVES PROFITABLE FOR FARMERS

Two years ago the United States department of agriculture and co-operating agencies organized a bull association in Webster County, Missouri, with 31 members. Now there are twice that many members, due to the success and usefulness of the association.

Before the association was formed there were 18 bulls owned by the men who afterwards joined it. Upon the formation of the organization the number of bulls was reduced two-thirds, because, after the members had been arranged into blocks, it was found that six bulls were enough. These were much finer animals, however. Judging them by their money value, the new ones were three or four times as good as the ones they replaced, since the average investment per bull was \$75 before organization, and \$276 after.

Yet, owing to the smaller number of bulls needed under the cooperative arrangement, the cost per farmer was but little more. The members had on the average \$43.71 invested in their inferior bulls, while the superior bulls owned by the association cost each member only \$53.45. This \$10 increase of cost per member meant a \$200 increase of value in the individual bulls from which they now have service—one thing which accounts for the doubling of the membership of the association after running two years. The value of the calf crop will probably show a very much greater increase.

To The Holstein Breeders of California

Gentlemen:

We have bought Sir Ormsby Skylark Rauwerd and will accept a limited number of cows for service. To you who are well versed in Holstein pedigrees and records we need say no other word. But to those of you who possibly may be young in the business or who are not fully aware of what the Ormsby strain has done and is doing, we would suggest that you do not waste valuable years by raising calves from inferior bulls. Sir Ormsby Skylark Rauwerd is the best son of old Sir Ormsby Skylark who sired amongst other notable cows Duchess Skylark Ormsby 1,506.36 lbs. butterfat in one year which is the world's record for any breed.

The dam of Sir Ormsby Skylark Rauwerd is Beauty Rauwerd Hengerveld 2nd a 34.5 lb. cow whose sire Prince Segis Korndyke had 59 A. R. O. daughters; and her dam was a 29 lb. cow.

Howard W. Vaughn, who has lately purchased a ranch near Dixon, has returned from his former home in Iowa and is bringing out a shipment of 20 Shorthorn bulls. Vaughn says that he is also bringing a few females but that he expects to gather most of his breeding herd in this state for the reason that he finds he can buy a better quality of cattle in California than he can get in the East for the same money.

Dr. Frank C. Gearhart of Manila, P. I., has been visiting breeders in this state with a view to selecting Ayrshire cattle, Berkshire and Duroc-Jersey swine and saddle horses. Dr. Gearhart has been in the islands for 13 years and says that there is a splendid opportunity for breeders of this state to develop a profitable business in the Philippines.

DON'T LET YOUR TREES DIE

Protect pruning cuts and wounds against infection with Pabco Pruning Paste. Ask your dealer. Manufactured by The Paraffine Companies, Inc., San Francisco, Calif.—Adv.

C. L. Hughes, manager of the California Breeders Sales and Pedigree Company, announces that the well known Revada herd of Guernseys, formerly owned by Bert Nixon and now the property of the Mission Land and Cattle Company, Yountville, has been placed in his hands for complete dispersion. The date of the sale will be announced later.

W. S. Guilford of Butte City Ranch has just returned from Chicago where he attended the International show. Guilford was elected a director of the American Shetland Pony Club. He is now director of two national record associations, having been given a similar honor with the American Shropshire Record Association last year.

V. F. Doicini, owner of the June Acres Stock Farm, Davis, reports the sale of a Duroc boar for shipment to the Philippine Islands. The boar was sired by Choice Wonder 3d, grand champion at the recent state fair.

A number of good official records have recently been made in the herd of registered Holsteins at Jane Garden Farm, owned by Fred W. Kiesel, Sacramento. Jane Garden Dirkje Korndyke, prize senior yearling at 1920 California state fair, freshening as a junior two year old, made 20.06 pounds butter from 391.8 pounds milk in seven days. She is a daughter of King Korndyke Pontiac. Jane Garden Tapioca De-Kol, a junior three year old daughter of Sir Aaggie De Kol Acme, made 25.60 pounds butter from 565.8 pounds milk in seven days, milking as high as 87 pounds in one day. Natoma Superba Pontiac, a four year old, made 24.86 pounds butter from 506.1 pounds milk in seven days, and Natoma Hermosa Pontiac, another

junior four year old, made 25.22 pounds butter from 522.3 pounds milk in seven days. These records were made under the direction of Harry L. Redd, who now has charge of this herd. Meadmore Prilly Queen, a splendid helper owned personally by Redd, made 27.54 pounds butter from 506.9 pounds milk in seven days after dropping a fine heifer calf by King Korndyke Pontiac 20th.

H. C. Witherow of Greenwood Farm, Live Oak, reports sale of a bred gilt to J. M. Hampton, Jr., Live Oak. This gilt was one of the best in the herd and was sired by Johnson's Defender Jr., and bred to Western Pathfinder for an early March litter. Mr. Hampton selected this gilt for the foundation of a choice herd of Durocs he expects to maintain on his ranch north of Live Oak. Also a boar pig to C. E. Riesche, Meridian. Mr. Riesche bought the foundation of a pure bred herd from Greenwood Farm in 1919. He is an extensive hog raiser and is rapidly changing from grades to pure breeds.

REVADA GUERNSEYS TO BE SOLD

The herd of registered Guernseys at Revada Ranch, Yountville, will be completely dispersed at public auction on Thursday, January 20, 1921. The herd contains a number of imported cows, including daughters of Governor of the Chene, Robert's Secret, and Raymond of the Preel XIII. This herd, which was founded by Bert Nixon, is now owned by Mission Land & Cattle Company, who also own the ranch, and have other plans in mind for the property requiring the dispersal of the Guernseys. The sale will be under management of California Breeders Sales and Pedigree Company.

JAS. J. JEFFRIES HOLSTEINS WILL BE DISPERSED

In order to enable a complete devotion of his time to his rapidly developing oil and mining interests, Jas. J. Jeffries, Burbank, will make a complete dispersal at public auction of his noted herd of registered Holsteins, on Thursday, February 3, 1921. The offering will contain the two highest record cows ever sold in California, one with over 38 pounds butter in seven days, the other with a recently completed record of over 1,140 pounds butter in one year. The great herd sire, King Segis Pontiac Jannek, will sell, also 40 of his daughters, including the entire show herd that made such a sensational showing at Los Angeles in October. The sale will be managed by California Breeders Sales and Pedigree Company.

W. A. THOMPSON HOLSTEIN DISPERSAL

W. A. Thompson, Holtville, will disperse his herd of 66 registered Holsteins at Rhoades & Rhoades' new sale pavilion at Hynes, on Saturday February 5, 1921. Included in the offering are two daughters of King Mead of Riverside, and many other young females of high record and popular breeding. California Breeders Sales and Pedigree Company will conduct the sale.

BACK TO NORMALCY WITH LIVESTOCK

(Continued from Page 787.)

stay on a lower level than the last few years recorded. Stability will be reached at a point somewhere between the two extremes.

Now is the time to do some sound thinking and planning.

It must be admitted that livestock production is one of the basic industries. Therefore it is sound and will endure. We all know that to be a fact. At times depressions and rough going will affect livestock, but only temporarily. As long as our agriculture lasts men will produce meat, milk and wool and the consuming public will furnish the outlet. We mention the above in passing only because there seem to be a good many men who consider that the livestock business has "gone to pot"; that the future is black; that people will stop eating meat and drinking milk and wearing wool and therefore if they get out at all they must lose no time in dumping and liquidating their holdings, or whatever they can get and scramble for safety. As yet it does not appear just what they expect to do immediately following the full fruition of their dire prophecy, but our guess, based on considerable observation, leads us to predict that these members of the "cold-feet brigade" will be the first to turn back to livestock the moment prices hit the upgrade. We are led to that conclusion because most of those who are lowest in the depths and who are crying the loudest belong to the extensive organization, the A. E. M., after easy money. The members of this organization are running true to form. They are the men who are always looking for something easy; always board the band wagon when boom times come (are, as a matter of fact, responsible for booms), and invariably ride till the parade starts back, at which point they jump off.

Over a period of years, it will be found that most lines of industry operate in circles. High points are invariably followed by low eras and low eras give way to better times. Naturally, all would be well if the average man were wise enough to always pick the low spot to buy on and the high spot to sell on. But despite the fact that most of us try to "beat the game," the number who make good is so small as to be almost negligible.

Over a period of years it will be found that the man who gathers the profits is the man who sticks through the low spots and so is in position to cash in on the high spots. It has ever been so and it bids fair to hold true in the future. In short, most of us are born gamblers and speculators, and while we sometimes have a world of fun counting our paper profits, in the end it is the man who sets out to build a permanent business and who has the grit to stick year in and year

WHICH?

If you had a given sum of money to invest, and on the one hand you were offered a security that is a proven producer, and readily salable to a large circle of buyers at a stable value, and on the other hand you were offered another security with little or no proven production, and one for which there is little or no public desire to buy, which would you take.

KING KORNDYKE PONTIAC 20TH

The mating which produced this outstanding young sire was made in our herd. He was born in the ownership of Anita M. Baldwin, sold by her at public sale as a yearling for \$6,500.00 to W. J. Higdon, who sold him at public sale in his semi-dispersal for \$12,000.00, both prices higher than that recorded by any other bull yet sold in California.

His sire, KING KORNDYKE PONTIAC, by King of the Pontiacs and out of a half sister to Prince Gelsche Walker, second dam for many years the youngest 30 pound cow of the breed, we regard as one of the most valuable breeding bulls in the state, and he will be the subject of the next announcement in this series.

His dam, MISS VALLEY MEAD DE KOL WALKER, with three world's records to her credit as a heifer, winner of the California State Dairy Competition over all ages and breeds, and with 1,113.58 lbs. butter in 342 days as a junior 3 year old, has been accorded by many breeders a place among the greatest heifers the breed has yet produced. She is one of the stars in the De Kol of Valley Mead family in our herd, where one of her sons is in active service, and another younger son is rated by many as the equal to any bull we have yet produced.

We feel that KING KORNDYKE PONTIAC 20TH is rightly rated as one of the best of the younger sires of the breed. His breeding entitles him to such a rating, and his young daughters stamp him already as a proven sire. He is the sire of the \$41,000.00 bull King Korndyke Pontiac Acme, has several other sons already at the head of good pure bred herds, where they went at prices from \$10,000.00 to \$5,000.00 as calves, and he is now in heavy service in one of the largest well bred herds yet assembled for foundation purposes in California.

We take pride in the part we had in the production of KING KORNDYKE PONTIAC 20TH, who now heads the large and excellent herd of registered Holstein-Friesians owned by

BURR FARM

LOS ANGELES

CAL.

In the selection of your herd bull, which is one of the most important investments any breeder has to consider, do you apply the same sound business principles that you would to other investments?

Every breeder must keep in mind constantly as a prime factor in his success or failure, that his herd bull contributes one-half or more to the value of every calf born in his herd, and that this is a most important consideration both in the individuals he retains as breeding animals and in those that he offers to other breeders.

Is your herd linked up, through your herd sire, with the big yearly producing families, whose members for generations have been proven, profitable producers and reproducers, and whose worth is so widely known that they find ready sale at stable prices to a large circle of buyers?

When you find DE KOL OF VALLEY MEAD, ARALIA DE KOL, RIVERSIDE SADIE DE KOL BURKE, or TILLY ALCARTRA as one of the dams in a pedigree, you have a standard of value that is widely known, and when two or more of these dams are found in combination further popularity and value is added.

We invite you to put your herd bull problem up to us, whether you want a high class sire to head a registered herd, or a high class bull to head a herd of grade cows, with a view to increasing production and improving type. Our knowledge of several generations of ancestors behind the bulls we offer is at your service, and our prices have always been regarded as most reasonable.

A. W. Morris & Sons Corporation
Woodland, California

out, who wins. Perhaps he doesn't have the fun the balance do, but he is the man who accumulates a competence for his family and himself.

The big thing to be decided by the average livestock man at the present time is whether he will play the role of the speculator, unloading his stock along with thousands of others for no better reason than that others are unloading, thus adding additional weight to drag the market still lower, or whether he will decide to continue his operations, perhaps on slightly curtailed basis, secure in the knowledge that a change for the better will come.

Those who have taken pains to investigate the livestock situation as it exists in this state and to check up local conditions with conditions obtaining in the Middle West and East are unanimous in the belief that the livestock business of California is on a sounder basis than in any other section.

In the first place, while our pure bred industry expanded very rapidly during the last two years, there was a legitimate reason for such expansion. This state was and is woefully short in number of pure bred livestock. During the last few years the speculative element that was responsible for the tremendously inflated values recorded in hundreds of Eastern sales was lacking in our transactions. California men, for the most part, bought because they were anxious to raise the quality of their productions, and not because they expected to resell at greatly increased values. All the time when Eastern price records were being shattered daily, California sales failed to reflect, to a noticeable degree, the Eastern markets. Anyone at all familiar with livestock realized that the fictitious values that were reported could not last. Now the very fact that our values at no time reached the spectacular levels referred to, constitutes the reason for the assertion that our industry is on a sounder basis than exists in the East.

Furthermore, there exists in this state a legitimate demand for breeding material capable of raising the standard of our common stocks—and that in the end is the ultimate reason for buying well bred animals, and both breeders and purchasers will do well to keep that fundamental fact in mind, now and in the future.

Too many of our "breeders" have not been real breeders. Men have gone into the business with little or no knowledge of the business and lacking a correct conception of the possibilities and limitations of the business. These men have learned their lesson.

Any man who engages in the production of pure bred livestock with the sole idea that the business is easy and a quick route to wealth will be disappointed. The best that can be hoped for is that out of the new recruits a few men will succeed as breeders. Note that we say "succeed as breeders." If the average man buys pure bred livestock with the idea and conviction that he can make pork or beef or milk more economically than with common bred animals, and is willing to give his purchases a fair trial, he will come out all right and will develop a profitable business; but if he makes purchases with the one idea that he can sell all of his productions at high prices he is headed for disappointment. What this state needs is more men who will buy a few pure bred females and a sire with the intention of conducting his operations on a commercial basis. For such men there was never a better opportunity than exists at the present time, and there never has been a time when it was more imperative for men to consider the possibilities of pure bred livestock.

Today—and certainly in the future—our production problems will largely center about production costs. We must either get our business on a profitable basis or quit. We can, perhaps, look for some relief through improved marketing methods, but we cannot expect too much from that source. Our profits will depend largely upon our own efforts independent from any mass movement. It is up to us as individuals and regardless of what course our neighbors follow, to own cows that will produce butter fat, or steers that will make cheaper growth, or hogs that will make cheaper pork, than those owned by our neighbors. We have our land, feed and capital and the

majority of us will continue in the business of growing crops, and we must have livestock to consume our crops and maintain our soil fertility.

Now then, let us just look around and see who among our neighbors have been making money over a period of years. True, we know that the average man has not been making money, but has Mr. Average Man in any line of effort made money? After all, isn't it the man who is above the average who has made money? Doesn't the fact that he has made money raise him above the average?

What chance have we to compete with our neighbors if their cows produce 400 pounds of fat and ours produce 200 pounds? What chance have we with steers that weigh 1,000 pounds at three years old with the man whose steers weigh 1,500 pounds at the same age?

Now, each of us pretty well realizes that the reason some cows produce more fat or steers carry more weight is that they have been "bred up" through the use of better blood. Knowing that to be true, are we going to admit as much, lay aside whatever prejudice we may hold and set about to follow the methods of these more progressive and successful men, or are we going ahead blindly along the road we have been traveling? If you want to make the change, start now! Don't put off making a start. There never was a better time than now, for the reason that there is a narrower margin between grades and pure breds than we have seen in years. Sell a few of your grades and invest the money in fewer pure breds. Make such investment not with the idea of at once setting yourself up as a breeder, but because it is just common sense good business to lay a foundation for what will in time become a pure bred herd. And once having started, "stick to your last." It's the men who go in to stay who are not stampeded with the crowd—who buy when the other fellows sell—who make the profit.

I think it was the late J. P. Morgan who, when asked how he made his money, replied that he "bought his straw hats in the fall"—in other words, he bought on low markets. The writer realizes that a good many men are financially unable to make a start with even a few pure breds, but he knows that there are hundreds who can make a beginning.

In closing, it might be well to remind a lot of producers that the war is over. We are led to call attention to that fact for several reasons. When the war caused an abnormal demand for certain grain crops, wheat, barley, beans, rice and corn, hundreds of men, attracted by the high prices, turned from livestock to grain. A lot of breeding material was sacrificed and today our total number of meat and milk animals is probably considerably less than four years ago. Many, perhaps the majority, of these grain growers increased their acreage each year. The present harvest throughout the country has yielded bumper crops, and today every warehouse in California is chuck full of grain for which the owners cannot find a market. It is folly to believe that all our grain crops will be consumed as human food—some will, of course; but in the end we must look to livestock to furnish an outlet. And right there the way back to normalcy is pointed out. If we continue to grow grain and grass—and who believes other than that we will?—we cannot escape the fact that livestock is our one best bet. Again, we can be certain that much land that has been in grain, and many acres yet to be brought under irrigation will be seeded to alfalfa. What are we going to do with our hay? There's only one answer. Size up the situation as you will, leave out the fundamental question of soil fertility, and it will be seen that year in and year out the production of livestock is a sound business. But don't lose sight of the fact that your profits will depend upon how efficient your livestock is. Furthermore, don't go into the business as a speculation. Go in on a conservative basis. Be willing to wait a few years to accumulate a herd of pure breds—it doesn't take long. Do not regard your herd simply as source from which to sell breeding material. Plan to have eventually a herd of pure breds for the one reason that such animals are capable of returning

you more for your feed and labor than will grades.

The writer knows of a number of men who are not worrying about the barley market and the lack of sale at \$1.50 per hundred. They are putting it through livestock—good livestock—and figure they are netting \$2 to \$2.50 for their grain. These men have the correct view; they are using better livestock to afford a market

for their grain. Maybe they are not making all that they should, but at least they are in better shape than many of their neighbors. Therefore we say—remember, the war is over; the time is here when we can't figure war prices for our grain, and it's time we get back to normalcy, and that we get back to normalcy without delay through the use of livestock—efficient livestock.

Sensational Dispersal!

Jas. J. Jeffries Herd

75—Registered Holsteins—75

Jeffries Ranch, Burbank, Cal.
Thursday, February 3, 1921

This is without question the most sensational group of registered Holsteins yet offered in a dispersal sale in the West, including the highest 7 day record cow and the highest yearly record cow ever offered on the Pacific Coast.

King Segis Pontiac Jannek Will Sell

The great Jeffries herd sire, King Segis Pontiac Jannek, will be a star attraction in this sale, as he is widely rated as the greatest proven sire ever offered for sale in the state.

40 Daughters of King Segis Pontiac Jannek

are in the sale list, including the wonderful 2 year old that was Grand Champion at Los Angeles, that has milked 99.6 lbs. milk in one day as a first calf junior 2 year old, and is making a yearly record that promises to carry her close to the top in her class.

A Wonderful Group of High Record Cows

The cows are mostly young, and include one with over 38 lbs. butter in 7 days one with over 1,140 lbs. butter in one year, several with 29 to over 30 lbs. butter in 7 days, several well along on year test and going right around the 1,000 lb. mark, and remember that the DAUGHTERS OF KING SEGIS PONTIAC JANNEK ARE OUT OF SUCH DAMS AS THESE!

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer.

DISPERSAL SALE

60 Registered Guernseys 60

Revada Ranch, Yountville, Cal.

Thursday, January 20, 1921

This is the first public dispersal sale of a major herd of registered Guernseys ever held in California, and provides a rare opportunity for the purchase of highly bred individuals of the breed.

This is the herd assembled by its former owner, Mr. Bert Nixon, without stint of trouble or expense, but the new owners of the ranch and herd, Mission Land & Cattle Co., have other uses in mind for the ranch and will make a complete dispersal of the Guernsey herd.

Imported Females

The herd includes a number of highly bred imported cows, including daughters of such sires as Governor of the Chene, Raymond of the Preel XIII, Robert's Secret, and others of commanding merit.

Large Percentage of Young Females

The herd is composed largely of young females, heifers and heifer calves, many of which are out of imported dams and by sires of rich and popular breeding.

An Unusual Offering of Bulls

There will be sixteen bulls in the sale, ranging in age from 2 years down to calves, affording such a selection as has never before been offered in this breed in California. Among these are several sons of Itchen Daisy May King of Langwater, who came to head the Revada herd at a price of \$3,000.00, a world's record price for the breed at that time.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer, except as announced in the sale ring.

HEADQUARTERS OF SALE will be at Palace Hotel, Napa. Revada Ranch is 9 miles north of Napa. Arrangements will be made for auto busses to meet parties coming in by train at this hotel morning of sale.

Arizona Dairymen Cooperate

By R. N. Davis

THE day of cooperation is here. Cooperation has changed a number of agricultural industries from losing enterprises to profitable businesses and will be a means of saving the dairy industry.

Before the organization of the California Associated Raisin Company the prices received by the raisin growers for their product barely provided them with an existence. The accomplishments of the Raisin Growers Association are so well known that they need not be given here. What is true of the Raisin Growers Association applies equally well to the citrus growers, the walnut growers, the peach growers and other farmers' cooperative market associations of the west coast.

The hog growers of the San Joaquin Valley of California by cooperative marketing of their fat hogs, viz., pooling, grading and selling at auction, made a saving the first year of the organization, of which \$100,000 is considered a very conservative estimate.

The poultry growers of California by cooperation have established a market in the entire country for their product. The Petaluma egg is served for breakfast on the tables of restaurants in New York City and other eastern cities as a fresh product.

Some one may say that it may be easy to organize an industry which is local, but to organize the dairymen of the country is a different proposition and covers too much territory to be practical. It is true a great many of the successful farmers' cooperative associations extend over a small area, but the area covered by many of these associations is by no means small. The California Farm Bureau Marketing Association includes seven counties; the citrus growers include a large part of Southern California, and the Prune Growers Association includes the entire prune area, which extends over a large section along the coast of central California.

The United States department of agriculture, cooperating with different state agricultural colleges and farm bureaus, has been very successful in establishing cooperative purebred bull associations which extend over areas containing several states. So many successful cow testing associations have been organized in different parts of the country that it is not necessary to comment on these.

Most of the cooperative associations referred to above are in the West. For fear that the reader may conclude that only in the West are cooperative associations successful, I shall mention a few of the many successful farmers' cooperative associations in other parts of the country. As long ago as 1914 there were in the state of Wisconsin the following farmers' cooperative associations: 347 creameries, 290 cheese factories, 35 livestock shipping, 5 fruit exchanges, 40 grain elevators, 609 telephone and 200 insurance. There are over 1,500 farmers' companies in Wisconsin. In the point of number and money handled, the dairy enterprises exceed all other cooperative agencies. I am told on what I consider good authority that cooperative grain elevators to a great extent gave the Non-partisan League much of the power which it possesses in the Dakotas at the present time.

Cooperative organizations are operating in every state in the Union. A great many of these associations are not accomplishing as much as they should. Possibly one of the principal reasons for failure of farmers' cooperative associations is the lack of support from the members. This in part may be caused by the method of organization and management. As an illustration, a great many cooperative creameries and cheese factories have been established by promoters in communities where there was not sufficient milk produced to justify a plant. These plants were poorly constructed, sold for a big price and an incompetent man was put in charge. There could not be anything but failure awaiting an institution established under such conditions. A great many of the cooperative creameries established several years ago failed. However, it is safe to say that as large a

percentage, or larger, of the cooperative creameries established during recent years is fully as successful as privately controlled factories.

What has been done by cooperation by the dairymen in other states can be done in Arizona. Because of the present condition of the dairy industry in the state there is possibly not a state in the Union in which it is possible for cooperation to be of as much value to the dairy industry as that of Arizona. Because of the exodus of dairy cattle from the state dairying is now in its infancy in the state. Dairying will again be the principal agricultural industry in the state. In reestablishing dairying in the Salt River Valley there are many things which can best be accomplished through cooperation. The quality of the average cow which was being milked in the Salt River Valley undoubtedly contributed more to the downfall of the industry than any one factor. Had only profitable producing cows been in use in the valley the dairymen would have been making money and would not have been so easily tempted by the possibilities offered by cotton. If dairying is to be a complete success in any section, only good, high producing healthy cows can be used. These cows can best be secured by cooperation among the dairymen, by using their cows collectively from the dairy sections of the country. Small dairymen and those just beginning in the dairy business frequently find the best sires apparently too expensive. As a result such breeders must either be satisfied with mediocre sires, pay a heavy service fee for a good one, or cooperate in the purchase of a sire. The bloodlines and producing ability of the herd must be improved by the use of good sires. Why not cooperate and get a sire with quality and plenty of it?

By organization and cooperation the dairymen may reestablish the dairy industry in the Salt River Valley on a proper basis and they will then have their association ready to organize cow testing associations and cooperative market associations and will be in position to purchase feed and other supplies cooperatively.

Cooperation is the only salvation for the dairy industry of the state. Is there one reason why the dairymen should not cooperate?

MILK AND CREAM SAMPLES FOR CHEMICAL EXAMINATION

Many samples of cream and some samples of milk are constantly received at the chemical laboratory of the state department of agriculture for butterfat testing. These samples are generally sent in by interested concerns or individuals who seek an accurate test by a disinterested party. Experience has shown that many of these samples come in such a condition that results of value cannot be obtained. Therefore, the following rules should be followed when samples of milk or cream are sent to this department for testing, because if they are not, consistent results cannot be obtained.

The milk or cream to be sampled should be well mixed by pouring from one can to another at least three times immediately before the sample is taken.

There should be 60 grams (about two ounces) or more in each sample.

The sample should be sent in a bottle provided with a good tight fitting cork stopper which should be tied in. No paper or cloth should be placed around the stopper. Round bottles with a rather large mouth are excellent for this purpose.

The sample should not be sent in a bottle with a metal screw cap, nor in the ordinary milk bottle with paper cap. These bottles frequently leak and thus cause the test to be unreliable.

A sample of milk should fill the bottle to within about one-eighth of an inch of the stopper.

Two or three drops of formalin (not more) should be added to a sample of milk, and it may well be added to a sample of cream.

Address, to insure prompt delivery, to Official Testing Laboratory, State

Department of Agriculture, Capitol Park, Sacramento, California.

If the percentage of solids in samples of milk or other values are desired, a larger quantity of milk or cream should be sent. If any interested party so desires, he can obtain suitable sample bottles and shipping containers from the department. These rules, of course, are not applicable to samples sent in for bacteriological examination.—C. F. A.

HOGS VS. VEGETABLE OIL

The Market Reporter finds that the price of hogs is affected by the quantity of vegetable oil. There are cottonseed oil, peanut, soy bean, coconut, and innumerable other oils which are either direct substitutes for lard or used to replace it in some form. The use of these vegetables was increased largely during the war because of fat shortage. The annual production of these fats aggregates a billion pounds.

As might be suspected, prices for vegetable oils have declined rapidly within the last two months or so, and the general situation concerning them is uncertain. This uncertainty makes it all the more necessary that the raiser of hogs should keep himself informed as to the basic facts of supplies and prices of these competitors of his products and of the demands of the public for them.

The supply of cottonseed oil on hand is materially larger than last year,

the bureau of census reporting 204,000,000 pounds, compared with 136,000,000 at the same time last year. The amount of peanut oil is apparently no greater, and reports indicate that the supplies of soy bean and coconut oil are less than last year. The bureau of markets reports less than 50,000,000 pounds of lard in cold storage, which is the smallest amount reported since December, 1917.

IMMUNIZATION AGAINST HOG CHOLERA

In dealing with hog cholera the California department of agriculture finds that there is a difference of opinion among veterinarians regarding procedure to prevent the further spread of a given outbreak.

Some hold that by injecting serum alone into the exposed animal it will inhale from the air and eat with the food sufficient virus to produce a permanent immunity. This contention is met by others with the argument that there is a possibility of the animal not inhaling and ingesting sufficient virus to produce an immunity over an extended period. There are others who prefer the single treatment in all exposed animals whether they do or do not show a rise in temperature.

In those already infected it is well to consider the consequences arising from the production of a negative phase when virus is injected. Then again there is the danger that the cells in the body of an infected hog may have become so debilitated by the infection that an injection of serum alone will not save its life.

It has been contended that small pigs are not capable of developing a permanent immunity and only those exposed to cholera should receive serum and six weeks later be given the double treatment. Government experiments demonstrate that small pigs are capable of developing a permanent immunity.

When administering the double treatment to exposed animals they should not show any symptoms of cholera such as a rise in temperature, loss of appetite, cough, or a staggering gait.

The question is frequently asked, "Will anti-hog cholera serum protect a hog exposed to swine plague." This can only be answered by stating that when an exact differentiation can be made between the two diseases this question may be definitely answered. Until then we must content ourselves with weighing and determining the value of arguments founded on theory or certain observations or experiments which do not, as yet, make it possible to state that swine plague is a disease frequently occurring entirely independent of hog cholera.—(S. O'T.)

HIGH PRODUCING GUERNSEY

Little Beauty 2d, owned by Brant Rancho at Owensmouth, is now one of 26 Guernsey cows that have four or more times fulfilled the requirements for the Advanced Register. Little Beauty 2d at 2½ years produced 10,480.13 pounds of milk, 563.20 pounds butterfat; at four years, 10,398.70 pounds milk, with 577.76 pounds butterfat; at five years 7,610.90 pounds milk, with 383.67 pounds fat; at 6½ years, 12,450.50 pounds milk, with 641.32 pounds fat. A two year old daughter of Little Beauty is now producing about 40 pounds of milk daily. She was first prize two year old California state fair, 1920. Warrior of the Rancho, a son of Little Beauty, sold at five months of age for \$1,000.

Manager Noggle of Lilac Ranch, Escondido, writes that he is finding a great demand for Aberdeen-Angus breeding stock. To meet this he has just brought from Yakima, Washington, 12 fashionably bred females and an Enchantress Trojan-Erica bull from the Congdon & Battles herd. He also selected two bred heifers for A. W. Wohlford of Escondido. These are outstanding individuals, one sired by Quality Lad of Rosemere, the other by Barb of Rosemere, and they are the foundation for a pure bred herd. In addition Mr. Noggle picked up at the Portland stock show a two year old cow, Blackbird C. B. 13, to be placed in Lilac show herd next year.

A Nationally Known Breeding Institution

The men at the head of the great Diamond Bar breeding institution are as interested in the future of the Duroc-Jersey industry as they are in the operation of their own ranch.

For this reason they guarantee every animal sold by them to be precisely as represented and stand ready to make every reasonable adjustment if dissatisfaction should occur.

The Month's Offerings

Registered spring boars and gilts by the Ace of Pathfinders, Mammoth Sensation Junior, Great Pathfinder and Royal Pathfinder. We have only a limited number of these choice Durocs.

To build up a pure-bred herd that will bring profit and pride, order this trio at \$500: A boar and two unrelated sows, all registered, and sired by the boars mentioned above.

Go in To Plant? Can still supply a limited quantity of our bud selected French prune on peach, Bartlett pear on Jap, and broken line of other trees. **BETTER TREES ARE NOT GROWN**. Prices most reasonable. We ship any quantity anywhere on approval. J. F. Miller & Sons, Healdsburg, California.

For Sale—10,000 Valencia one and two year buds; 2,000 Eureka lemon two year buds; Navels, M. S. Pomelos; 1000 Wonderful Pomegranates; 3000 Texas Umbrellas; 100 Kadota figs; 2000 Mission Olives; Sweet and Sour orange seed-bed stock. Southland Nurseries, 1941 East Colorado Street, Pasadena, California.

For Sale—Oregon Plum and Dollar Strawberry plants now ready for delivery, \$2.00 per hundred postpaid. Burbank Thornless Blackberry, \$15.00 per hundred. Walnut Seedlings, 2-3 feet, \$15.00 per hundred, 1-2 feet \$10.00 per hundred. Ben Putnam Nursery, Winters, California.

Royal Apricots, Tuscan, Sims and McClure Clings, Elberta and J. H. Hale Freestone Peaches, Santa Rosa and Beauty Plums, Pear, Apple and Walnut Trees. Grapevines, Berries, etc. Order now; leading varieties scarce. Los Nietos Valley Nursery, Downey, California.

For Sale—Placenta Perfection and Eureka walnut trees, also Eureka Lemon and Almond trees. These are all high grade stock. Ketscher's Nursery, 1101 E. 4th St., Santa Ana, California. Phone 572WK

For Sale—80,000 Black Walnut Seedling trees, one year old next spring, ready to graft, at Van Nuys, California. Can leave on ground as long as desired. Get my price. Geo. M. Ketscher, 1101 E. 4th Street, Santa Ana, Phone 572W.

For Sale—Walnut trees, fine stock Eureka grafted on black root. Prices, 4-6 feet in height \$2.00; 6-8 \$2.25; 8-10 \$2.50; 10-12 \$2.75. La Puente Walnut Nursery, Puente, California. Phone 103.

For Sale—100,000 Florida Sour Orange Seed-bed Trees; 100,000 California sweet seedling orange seed-bed trees. **SOUTHLAND NURSERIES**, 1941 East Colorado Street, Pasadena, California.

Kadota Fig Trees—Taft lineage and direct from original Taft Kadota trees. Grown for root formation. Make reservations. John H. Oliver, 1969 Wilcox Avenue, Hollywood. Phone 57116

Seed Bed Stock—Florida sour and California sweet. Nursery 100 Ventura Street. Address Paul B. Magee, R. F. D. No. 2, Box 499, Pasadena.

TREES—TREES—ALFALFA SEED Etc. Full stock—best varieties, now. Write J. L. LAWSON, San Jose, California.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

Grape Vines, orange, lemon, grapefruit trees; citrus seed bed stock. L. A. TUTTLE, R. 1, Box 385, Pasadena.

Peach and Apricot Trees—Leading varieties. C. Truelsen and Son, Hemet, California.

FERTILIZERS

Gypsum and Lime—Price Right Order early for prompt delivery H. B. Matthews, 1010 N. Madison Ave., Pasadena.

SULPHUR AS A FERTILIZER

(Continued from Page 801.)

phur. Top dressing in legumes would be the logical time in the rotation to provide the sulphur when it is known to be deficient in amount.

While the results obtained by Reimer are certain not to be duplicated on certain types of soils in the eastern United States, as for instance on soils deficient in lime, or on acid soils, the results indicate that it is worth while to test out the value of sulphur generally through the country. The fact that the early users of gypsum over a century ago had similar results with soils in Pennsylvania and Virginia should encourage renewed experimentation with sulphur fertilizers, under conditions that preclude confusing one limiting factor with another. As already suggested, the early failures were probably caused by the soils being deficient in phosphorus rather than sulphur in some cases, or deficient in both at once, or at any rate not in sulphur alone.

We know enough now to make our tests crucial as to which element or elements limit production. The only way we can know the facts will be by actual tests. The system of soil fertility upon which our vast expenditure for fertilizers is based should be examined and tested with open, unprejudiced minds. The tests of sulphur-containing fertilizers should be made over wide areas in the eastern United States, for there must be many soils in which sulphur is deficient for optimum nutrition of high sulphur-requiring plants. In many cases where superphosphate has been used with success, it may be the sulphur rather than the phosphorus that is the valuable element. In such cases substi-

tution of the cheaper gypsum might yield as satisfactory results as the more expensive fertilizer.

American agriculture would be vastly benefited by extensive experimentation along the lines suggested, with strictly controlled conditions under which alone can we have a proper interpretation of results. With our expenditure for fertilizers much in excess of a hundred million dollars annually, it is highly important that our fertilizer practice should be put upon a rational basis at the earliest possible moment.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Chickens Trespassing

What redress has a farmer if his neighbor's chickens come over and scratch up and eat his new seeded barley after he has warned the neighbor of the damage his chickens are doing, to which warning the neighbor pays no attention?—Subscriber, Orland.

It is probable that you would have an action for damages for the value of the crop destroyed by the chickens and if this property is so fenced as to enable you to take advantage of the estray act you can imprison the chickens. The writer has noticed that chicken dinners have quite an effect in this matter.

Title

Can a title be clouded or a deed annulled if after a year's ownership with a guaranteed title it was shown that the party giving the deed only held the ownership in trust for another?—Subscriber, Clearwater.

If the party who executed the deed held a fee simple title to the property and received a good consideration therefor, in the ordinary case, the grantee would not be affected by any secret relations existing between such grantor and some unknown third party. However, the question here is so general that a statement of the specific facts might entirely alter the conclusion.

Mining Claim on School Lands

How can a mining claim be filed on lands that are surveyed in a school section and also located in a United States forest reservation? The ground is non-agricultural.—Subscriber, Eureka.

The rule relative to school lands provides that mineral lands do not pass under grants made for educational purposes, if they are known to be mineral lands at the time when the public surveys are completed and approved, at which time the grants take effect. Lands in forest reservations reserved by the proclamation of the president under acts of congress are appropriated for a special public use and are withdrawn from the public domain, but on proof being made to the secretary of the interior that such lands contain mineral lands, they are excepted from the force and effect of the reservations by act of June 4, 1897. An examination of the particular land in question would, therefore, be necessary to be made before the exact course which the party should adopt may be definitely stated.

DON'T NEGLECT TREE WOUNDS

Neglected tree wounds lead to wood-rot or wood decay which is responsible for an appalling loss of valuable producing trees. Protect pruning cuts or other wounds on your trees with Pabco Pruning Paste. Ask your dealer. Manufactured by the Paraffine Companies, Inc., San Francisco, Calif.—Adv.

VITALITY Needed for Winter Egg Production

During molt and through the process of building new feathers, you'll find vitality low in hens—susceptible to disease with the result of "loafing" in producing eggs.

LACTEIN CONDENSED BUTTERMILK

shows its re-vitalizing power at this time—it puts life, health and productiveness into the hens. Combining as it does, the exact proportion of albumen and protein for eggs and the tonic of Lactic Acid, it means a product of food value and tonic that has no

equal. And it is so easy and economical to feed! Profit from the experience of the largest poultry raisers and make an investment in LACTEIN Condensed Buttermilk TODAY. Stimulate the flock to industry and health when eggs are scarce and the price is good.

You'll find LACTEIN Condensed Buttermilk a LIFE-SAVER for Baby Chicks. It prevents White Diarrhoea and those diseases so fatal to the delicate chicks. Add profit by saving the 50 per cent you ordinarily lose.

When Writing Advertisers Mention California Cultivator

Adventuring With Chickens

By Jean A. Koethen

DEAR DAD: There's nothing like the shelter of your own vine and fig tree, even if the fig tree is only three feet tall and the vine has never borne a grape. And laying out five acres in such a way as not to waste an inch is the most fascinating work I ever did. Fortunately, we do not lack advisers. Half a flock to the north of us lives a man who is caring for 1,200 hens without help. He has not even a wife to help with the baby chicks. Between you and me I think he is proud of his lonely condition. He wouldn't have any woman messing around his incubators and roasting his baby chicks to death—not he. I wanted to go over and get some ideas about the brooder house, but Bob discouraged me. He says Mr. S. has lived alone so long he hardly knows how to talk to a woman. We must have him over to supper some evening. He talks very readily to Bob, however, and has made some valuable suggestions about economizing labor. He says the laying house should be in the center of the space devoted to the chickens, with yards for raising green feed on one side, the feed house on another, or, better still, directly opposite the middle of the long house, and the brooder house off a little to one side. We must plan also for several colony coops for the young stock after they are out of the brooder house.

If we follow the system which is generally followed in this section we must have separate weaning coops for roosters and pullets, for the roosters can be crowded more closely into a coop than is good for the pullets. As the cockerels are sent to market as soon as they weigh a pound and a hen, they do not need much exercise. A coop four feet square answers for 50 cockerels, but the pullets need more coop room and larger yards. We have set apart an acre for colony houses for the pullets. This is in the northeast corner of the place where they will be as little disturbed as possible.

Our bachelor neighbor may be fussy about his incubators, but the way he keeps his pullets doesn't appeal to me at all. He has 50 three months old birds in a little coop not more than four feet square, and when he cleans it I couldn't guess—once a year, maybe, and the last time was Christmas Day. No woman would let her little lady pullets run over such heaps of manure. Their little yard is not more than ten feet square, and there they live, scratching in droppings when they scratch—if they ever do—picking their grain from under droppings. I suppose, with never a clean, soft place to dust themselves, nor a bit of green to peck, outside of what they get in their trough.

Our other neighbor, Mr. S., whose wife has given me a lot of hints, does things much more to my liking. He has more land than we, and his pullets are in quarter acre runs, 50 pullets to a run. Their colony houses are open entirely on one side and partly on another, and they have a perfectly lovely lot of shade. He not only has trees, walnut and apricot, in the runs, but there are vines climbing over the fences. On hot days I notice the pullets all crowd under the vines, wallowing in the soft dirt. It just makes one envy chickens to see them so comfortable.

We are going to follow Mr. S.'s plan as nearly as possible. We cannot allow so much ground to each pullet pen, but then we shall not have so many pullets. Bob thinks we had better not order more than 500 chicks for this first venture. The men he has talked to say if we can raise 400 this year, 200 pullets and 200 cockerels, we shall not be doing so badly. If we try to raise more we may not raise so many. Queer reasoning, isn't it? They say the more chicks you put in a single flock the more you must expect to lose and the more culls there will be. Of course it isn't quite as if we had never raised chicks in brooders, a hundred or so at a time. I can't see, myself, why it should not be just as easy to raise 500 chicks in a lot as 20, provided you keep them warm and give them enough to eat, but Mr. S. laughs at me when I talk that way and says "All the tender-

feet have to have their fling, but they never try it but once." I suppose he means, don't try it again till they have learned the secret, if it is a secret. Why there should be any secret about raising chicks when everybody seems so willing to tell us all he knows and then some, is more than I can see, but Bob says there may be some things nobody can tell us.

Our 200 pullets are to be housed in colony houses eight feet by ten, 40 pullets to a house. That means that we shall need five houses. We are going to seed an acre to alfalfa and set the five houses, one behind another, all fronting south and about 50 feet apart, along one edge of the alfalfa. With the alfalfa on one side, two rows of deciduous fruit trees on the other and a good tight fence to keep the pullets in their own run when they are not wanted in orchard or pasture, I figure we are providing them with range to suit the most fastidious layer. There is room in the houses for rainy days, which we are told are not too numerous in this land of sunshine. They can have a little time every day on the alfalfa after it is started, and can run in the orchard when there is no fruit on the trees. We shall plant some garden between the rows of trees and must be able to control the pullets absolutely.

The laying house can wait till next summer, but we are going to put up the brooder house and the colony houses immediately. The brooder house is modeled after one I saw on the ranch of a very successful poultrywoman. It is all windows on the south, with little runs three feet wide running back from the windows to a built-in hover heated by a hot water pipe. We have visited a good many ranches and talked to a lot of people. Some of them use the big brooder stoves that will keep 500 or 1,000 chicks warm at once. Some use electric hovers, which hover as many as the stoves or more. Others, again, use these hot water hovers and keep only 100 chicks, sometimes only 50, in a run. Every man had his own good reasons for his own system of brooding, and we selected the hot water plan, not because we could find that it was any better, but because it seemed to us a little more nearly fool proof. There seems to be no question that you can be a little more certain all your chicks are warm when there are only 100 in a hunch than when there are 500. Anyway, it looked so to us, and we found some of the men who use these hot water brooders were raising over 90 per cent of the chicks hatched. When we have acquired a little more experience we may want to take out the pipes and partitions and put in a big stove. For the present this seems safest. In all the houses of this type we have seen the chicks do look so delightfully comfortable in their little runs, with a window full of sunshine and a little yard outside to amuse themselves in when they feel like going out. It reminds me of the doll house Jessie and I built under the old apple tree—everything doll size, and every doll happy and comfy.

We are going to fence off the runs before we build the brooder house, for they must be planted with green crops at once. All the poultrymen about us are very particular about having green for their chicks to run on. Some have alfalfa, and some harley, while some plant rape and beets. Perhaps we can get in some early vegetables and leave the stalks and roots for the chicks.

1000 Eggs in Every Hen

New System Of Poultry Keeping — Get Dollar A Dozen Eggs—Famous Poultryman

TELLS HOW

"The great trouble with the poultry business has always been that the laying life of a hen was too short" says Henry Trafford, International Poultry Expert and Breeder, for nearly eighteen years Editor of Poultry Success.

The average pullet lays 150 eggs. If kept the second year, she may lay 100 more. Then she goes to market. Yet, it has been scientifically established that every pullet is born or hatched with over one thousand minute egg germs in her system—and will lay them on a highly profitable basis over a period of four to six years' time if given proper care.

How to work to get 1,000 eggs from every hen; how to get pullets laying early; how to make the old hens lay like pullets; how to keep up heavy egg production all through cold winter months when eggs are highest; triple egg production; make slacker hens hustle; \$5 profit from every hen in six winter months. These and many other money making poultry secrets are contained in Mr. Trafford's "1,000 EGG HEN" system of poultry raising, one copy of which will be sent absolutely free to any reader of this paper who keeps six hens or more. Eggs should go to a dollar or more a dozen this winter. This means big profit to the poultry keeper who gets the eggs. Mr. Trafford tells how. If you keep chickens and want them to make money for you, cut out this ad and send it with your name and address to Henry Trafford, Suite 243R, Tyne Bldg., Binghamton, N. Y., and a free copy of "THE 1,000 EGG HEN" will be sent by return mail.—Adv.

The Kresky Brooder Stove or "Pride of Petaluma"

Broods from 500 to 1,500 CHICKS. Fire NEVER goes out, temperature the same during STORMY weather, furnishes WARM, FRESH AIR, radiates HEAT to FLOOR where CHICKS are, GREAT DEMAND for POULTRY and EGGS. Stove burns COAL OIL or DISTILLATE.

PETALUMA, CAL.

We have not decided whether to plant all the runs alike or make them all different. Bob says we can learn more if we try several different things, and he quotes Scripture for his position. "Prove all things; hold fast that which is good."

This is all I can write today. Wish you were here to eat oranges with us. They are green, but we like them. Your loving daughter, Bessie.

CALIFORNIA EGG LAYING CONTEST

By Jean A. Koethen

THE California egg laying contest at Santa Cruz ended its first year November 15, with Bellows Brothers of Lakeside, San Diego County, leading. Their ten pullets established a record of 2,153 eggs for the year, the highest producer laying 257 eggs and ranking fourth in the contest as an individual.

The highest individual record in the contest was that of a hen belonging to D. B. Walls of Petaluma, which laid 297 eggs and is still at it. She was hatched in May, 1919, and from November 15, 1919, to November 15, 1920, laid 20 eggs or more per month. In December, 1919, and January, 1920, she laid 28 eggs. Had the contest continued three days longer she would have reached the 300 egg mark.

Ten Highest Pens

The ten highest pens in the contest were: Bellows Brothers, Lakeside, 2,153 eggs; S. L. Gibson, Santa Cruz, 2,054; D. B. Walls, Petaluma, 2,049; Enterprise Ranch, Chino, 2,045; W. J. Neef, Santa Cruz, 2,009; R. C. Gibson, Newhall, 1,978; B. F. Rose, Santa Cruz, 1,950; G. G. Barker, Santa Cruz, 1,944; W. Wood, Santa Cruz, 1,925; Geo. Gray, Santa Cruz, 1,895.

Highest Individuals

The ten highest individuals in the contest all laid over 250 eggs during the year. Their average as a whole is 263.3 eggs a year. They are hens belonging to D. B. Walls, Petaluma, 297 eggs; P. Pasquale, Inglewood, 268; S. L. Gibson, Santa Cruz, 266; A. M. Webb, Santa Cruz, 262; S. L. Gibson, Santa Cruz, 260; Bellows Brothers, Lakeside, 257; Hollis Peck, Santa Cruz, 256; Hollis Peck, Santa Cruz, 257; P. Pasquale, Inglewood, 256; Enterprise Ranch, Chino, 251; Geo. Gray, Santa Cruz, 251.

High Average

Out of 333 hens entered 119 laid over 200 eggs during the year. The average for the entire flock was 175.3 eggs, or 48 per cent production, for the year.

Contest Ration

The hens in this contest were fed the following ration which was recommended by the poultry division of the university:

Mash; 240 pounds mill run, 180 pounds ground oats, 180 pounds middlings, 100 pounds soy bean meal, 100 pounds meat scrap, 30 pounds charcoal, 4 pounds salt.

Grain; 200 pounds mlo, 200 pounds wheat, 200 pounds cracked corn, 200 pounds barley.

The flock consumed approximately 80 pounds of grain and mash per hen during the year, or a little over 3 pounds of grain and 3 pounds of mash per hen per month. Grain was scattered in the litter, one-third in the morning and two-thirds at night. Mash was before them constantly in hoppers. A crumbly mash was fed at noon. Green feed was before the hens from 9 a. m. till evening, the consumption of greens being approximately 3 pounds per hen per month. Sprouted oats were fed once a day.

New Contest

The second year's contest began November 1 in new buildings provided by the Santa Cruz chamber of commerce at a cost of over \$12,000. This contest is a national one, several entries coming from outside the state. There are 56 entries of ten hens each. The third year's contest will begin October 1, 1921, and will be an international contest with entries from England and other European countries.

Painted buildings and well kept fences bring buyers to see the owner of the farm.

Bean Turbine Pump Recently Installed for J. Speciale near San Jose

WATER!

The water level in Mr. Speciale's well was getting so low that his old vertical pump was almost useless. Instead of digging the pit deeper and trying to use the old pump a little longer, he installed a Bean Turbine in the same well and solved his water problem for all time. You can do the same. Veterinary

Heifer Thin

I have a Jersey heifer coming in with third calf in about three weeks. She is poor in flesh now and am afraid that she won't give much milk when she does come in. She will not eat bran, dried beet pulp nor pumpkins. I have the finest kind of alfalfa hay and she doesn't seem to eat much of that. What can I feed her to fatten her up?—Subscriber, Anaheim.

It will be practically impossible to get your heifer in good flesh before freshening, particularly since she will not eat well. It is not desirable at this time to attempt to feed her too heavily, as it might throw her off her feed and put her back farther than ever. I would suggest that you give her a good dose of raw linseed oil, which might bring her on to her feed. I would suggest that you give her about a quart as a drench. Follow this up by a little bran mash to which you might add some beet pulp or some rolled barley. Feed this together with a little alfalfa hay and ensilage if you have it. If you can pasture her out on some green grass or cut some and take it in to her. As soon as she freshens it would be well to feed her lightly at first and then bring her on to feed with such feeds as bran, beet pulp, pumpkins, coconut meal, etc. If you find that she does not put on flesh readily, I would suggest that you have her tested for tuberculosis. Tuberculosis often causes animals to remain thin and sometimes causes them to lose their appetite as well.—G. E. G.

Dog Has Skin Disease

Our dog has some skin disease, evidently. Whatever it is, it irritates him greatly. He scratches himself and seems restless and the hair is falling out. Has been thus afflicted for a long time but gets no better. What can be done for him?—Subscriber.

This may be one of three different things, according to the information you have given. It may be one of two kinds of mange, or it may be eczema. It is possible that it may be a combination of mange and eczema. The most common form of mange is the so-called sarcoptic and is caused by a minute organism. This burrows into the skin, causing intense itching. This irritates the skin so much that the animal scratches the skin, irritating it more. This often causes eczema, which may be of constitutional origin if there is any tendency towards eczema. The best treatment for this

kind of mange is to wash the dog thoroughly in order to get the skin well softened. A mixture of lard and sulphur in the proportions of one teaspoon of sulphur to a tablespoon of lard, should then be applied and thoroughly rubbed into the skin on every part of the body. It is sometimes desirable to wash the animal again in the morning, particularly if it is a house dog. The organisms will probably be destroyed by the fifth or sixth day, but in order to make sure, the treatment should be continued for the full ten days. The other type of mange is not so common but is extremely difficult to get rid of. This is called follicular mange. This is somewhat similar to the above mentioned type of mange. It can sometimes be transmitted to human beings. It is believed that the parasite present in this case is a mold fungus which attaches itself to the roots of the hair. This causes the hair to drop out badly. It is usually somewhat feverish around the affected parts. This disease spreads rapidly and gives off an offensive odor. There is not a great deal of itching ordinarily, so from what you mention of the dog scratching him-

self almost continually, it would indicate that the former mentioned mange was probably the difficulty in your case. With this latter mange, after the disease has made a great deal of progress it usually takes six or eight months to cure it, and unless the dog is an exceedingly valuable one it would perhaps be best to put him out of the way. Anything that may cause scratching or undue heat or moisture may be local cases of eczema. Often errors in feeding will bring out eczema on a dog. If he has been getting too great a percentage of starchy foods it would be well to reduce them and add more meat to the diet. The indications are that your dog is troubled with sarcoptic eczema and the curing of this by the use of the sulphur and lard treatment will probably do away with the inflammation and the subsequent cessation of any eczema, if it may be present. A dog in good health and under normal conditions is rarely troubled with eczema.—G. E. G.

The Central California Wool Growers have reduced wages of sheep herders and shearers from \$90 to \$70 per month.

DEFINING THE ANXIETY

"What do you think is the cause of unrest?"

"Haven't noticed any around this place," rejoined Farmer Cornrossel. "The resting part takes care of itself. What I am worried about is unwork."

INTENSELY OCCUPIED

I try not to loiter nor shirk,
Yet this my intention doth balk;
I am often too busy to work,
But never too busy to talk!

REQUEST FOLDER NO. 30

LAYNE & BOWLER CORPORATION
900 SANTA FE AVE., LOS ANGELES, CALIF.

District Offices at: San Francisco, Sacramento, Willows, Modesto, San Jose, Merced, Fresno, Tulare, Bakersfield, Riverside, Santa Ana.

Your hens
can't eat color
—they want feed!

Your hens don't care about the color of their feed—why should you? They want feed that is good—and you want feed that is good for them.

The color of your feed has absolutely nothing to do with its feeding value. It may be light or it may be dark and yet not vary one-tenth of one per cent in actual feeding value. Feed for your hens should be bought on its chemical analysis—no its actual feeding value—on its color or texture.

Take SURELAY, for example. It may never vary in color from time to time. But it never varies in chemical content—in net feeding value. It contains at least a dozen ingredients balanced and blended according to a formula that has stood the

test of time. Our daily laboratory tests (something the hand-mixer does not and cannot have) assure absolute uniformity at all times.

SURELAY is proud of the things that go into its making. Long before the present feed law became effective, the exact analysis of SURELAY was printed on the back of every sack. Today, as always, you know what you're buying when you buy SURELAY. You know it is a top-grade, uniform feed that will make your hens pay by making them lay.

If you haven't seen the new edition of our booklet, "Makes Hens Happy," we'll be glad to send you a copy. Don't bother to write a letter—simply fill in the coupon below and mail today!

STOCK AND POULTRY FEED DEPARTMENT
SPERRY FLOUR CO.
STOCKTON, CALIFORNIA

SURELAY
"A Sperry Product"

A good
thing to
remember!

More and more poultrymen have begun to see the light on this color question. The less you care about color or texture and the more you care about feed value—the better feed you will buy, the better your hens will like it, and the more eggs you will get. That's a simple, straight formula—and a mighty good thing to remember.

THERE'S one test—and only one test—of feed. And that's *feed value*. No poultryman—no matter how seasoned he is—can tell the quality of a feed simply by *looking* at it or *feeling* it. Because a feed can be light or dark, fine or coarse, and yet not vary one-tenth of one per cent in actual feeding value.

Is there any difference in the feeding value of yellow, white or mixed corn? No! Is there any difference in the feeding value of white, gray or red oats? No! Is there any difference in the feeding value of white or red wheat? No! The same thing applies to meat meals, oilcake meals, charcoal and other ingredients that go into the blending of a proprietary feed.

That's why color means little, if anything. Texture means little, if anything. Feed value means *everything*! Feed value, after all, is the thing you pay for.

And SURELAY sees to it that your hens get the *same feed value* every time. It may vary in color from time to time. It may vary a bit in texture. But it *never* varies in net feeding value. Our daily laboratory tests take good care of that!

If you want to see why SURELAY is a high-grade *uniform* feed that will make your hens pay by making them lay—send for the new edition of our booklet, "Makes Hens Happy." Your copy is waiting for you—and it's free. Simply fill in the coupon and mail today!

The Famous Five-Ton Caterpillar Tractor

**Now for the first time available for immediate
delivery in this territory**

Here at last is the tractor you've waited for—you who have wanted a tractor of smaller size and less power than "Caterpillar" 75 and 45 Tractors—you who have read of this tractor's achievements in France—you who have heard of this tractor's wonderful power, stamina and versatility, from the boys who came back from "over there." It's the famous 5-Ton "Caterpillar" Tractor. During the war the Government's requirements took our full output. Since then, accumulated domestic and foreign orders have had to be taken care of. Now for the first time we are privileged to offer the 5-Ton in this territory. But even now—for a time at least—the supply is limited. You must act quickly to secure immediate or early delivery. Write, phone, wire or call at the nearest Holt office without delay.

Compare, but don't confuse the "Caterpillar" 5-ton tractor with other tractors. It is built to the standard of performance, not of price. It was designed by Holt engineers, in conjunction with other foremost automotive engineering talent of the world at our government's disposal during the war. It has successfully met the most severe requirements that any machine has ever been subjected to, on two continents, in all classes of work—farm work, contracting, freighting. New York City recently ordered 50 of the "5 Tons" to solve its snow-disposal problem. There's not an experimental or untried feature in its entire construction. It has proved—conclusively proved—its superior merit. And the result is found in its unfailing, dependable, economical and trouble-free performance. That means farm work done quickly, properly, without delay—and at lowest cost per horsepower-hour. The purchase of a "Caterpillar" Tractor is an investment—safe, sure and productive of liberal returns.

One Dollar Yearly

Twelve Million Acres Under Irrigation

WHEN Theodore Roosevelt took a strong hand in the matter of the Panama Canal there was appreciation of the fact that America had taken

hold of a big proposition. It might cost a hundred million, but America was big enough and could do it. It did cost the hundred million—perhaps several times that—but we did it.

Now comes California with a big suggestion. As a state, and without any thought of government aid, it is suggested that we are able at the cost of a billion of dollars to wonderfully

increase our productive ability. The other day the floods came down the sides of the Sierra Nevada and did untold damage. Thousands of acres of rice fields were flooded at harvest time and many a farmer lost the savings of a lifetime. Another midsummer will see need of those same flood waters for purposes of navigation and for watering the thirsty land. And we are asking, "Why is this winter's destruction and this summer's lack continued from year to year?" Engineers say it need not be, and they are dreaming of stored floods which will mean vast addition to comfort and to wealth. Hundreds of storage possibilities have been outlined, and there are doubtless others not yet known. It required much investigation and many dreams on the part of many of the far seers to bring the matter to a point where "practical" human beings would stop long enough to consider it.

At first thought it seems impossible that California should attempt to finance so immense a project as one which will cost a billion of dollars, or, to be more exact, \$750,000,000, which is now hoped as the limit cost of carrying out the great system of storage reservoirs which will supply an everlasting source of power, rivers with water enough to make them navigable all the summer through, and canals with water for irrigation purposes which will mean millions of additional wealth in crops. But the plans as laid down by Robert B. Marshall, which have been referred to during the past two years, are now sufficiently complete that an association of representative Californians has been organized to push them to completion, or, at least, the present association hopes to conduct an educational campaign which will secure through state or other activities the operating organization. The plan is that the accomplishment of this great project shall be in the hands of all the people. The name of the new organization is The California State Irrigation Association. It has established headquarters in Sacramento and the officers are: Hon. C. A. Barlow, president; J. F. Mallon, vice-president and secretary; Hon. Alden Anderson, treasurer; E. O. McCormick and Hon. L. L. Dennett, others members of the executive committee; with Col. R. B. Marshall, consulting engineer, and L. C. Davidson, manager.—C. B. M.

Here is an outline of the Marshall plan as laid down by the association:

California water and power resources under control of state.

Complete utilization of all reservoir sites, both in the mountains and along the foothills.

Grand canal system to distribute flow from Sacramento and San Joaquin Valley streams.

Lock and draw dam to be constructed across Carquinez Straits to prevent the encroachment of salt water into the valley of California. This control of the water will forever protect the delta lands and make it unnecessary to build or maintain levees. Withholding water in reservoir sites in mountains and foothills will obviate hazard from floods.

Ample irrigation for five great valleys of California—Sacramento, San Joaquin, Santa Clara, Concord and Livermore.

San Francisco Bay region to receive ample water. Four times as much water as present aqueduct now delivers will be provided for Los Angeles from Kern River.

Surplus water from Klamath River basin is to be diverted through the Siskiyou into upper Sacramento River to augment supply.

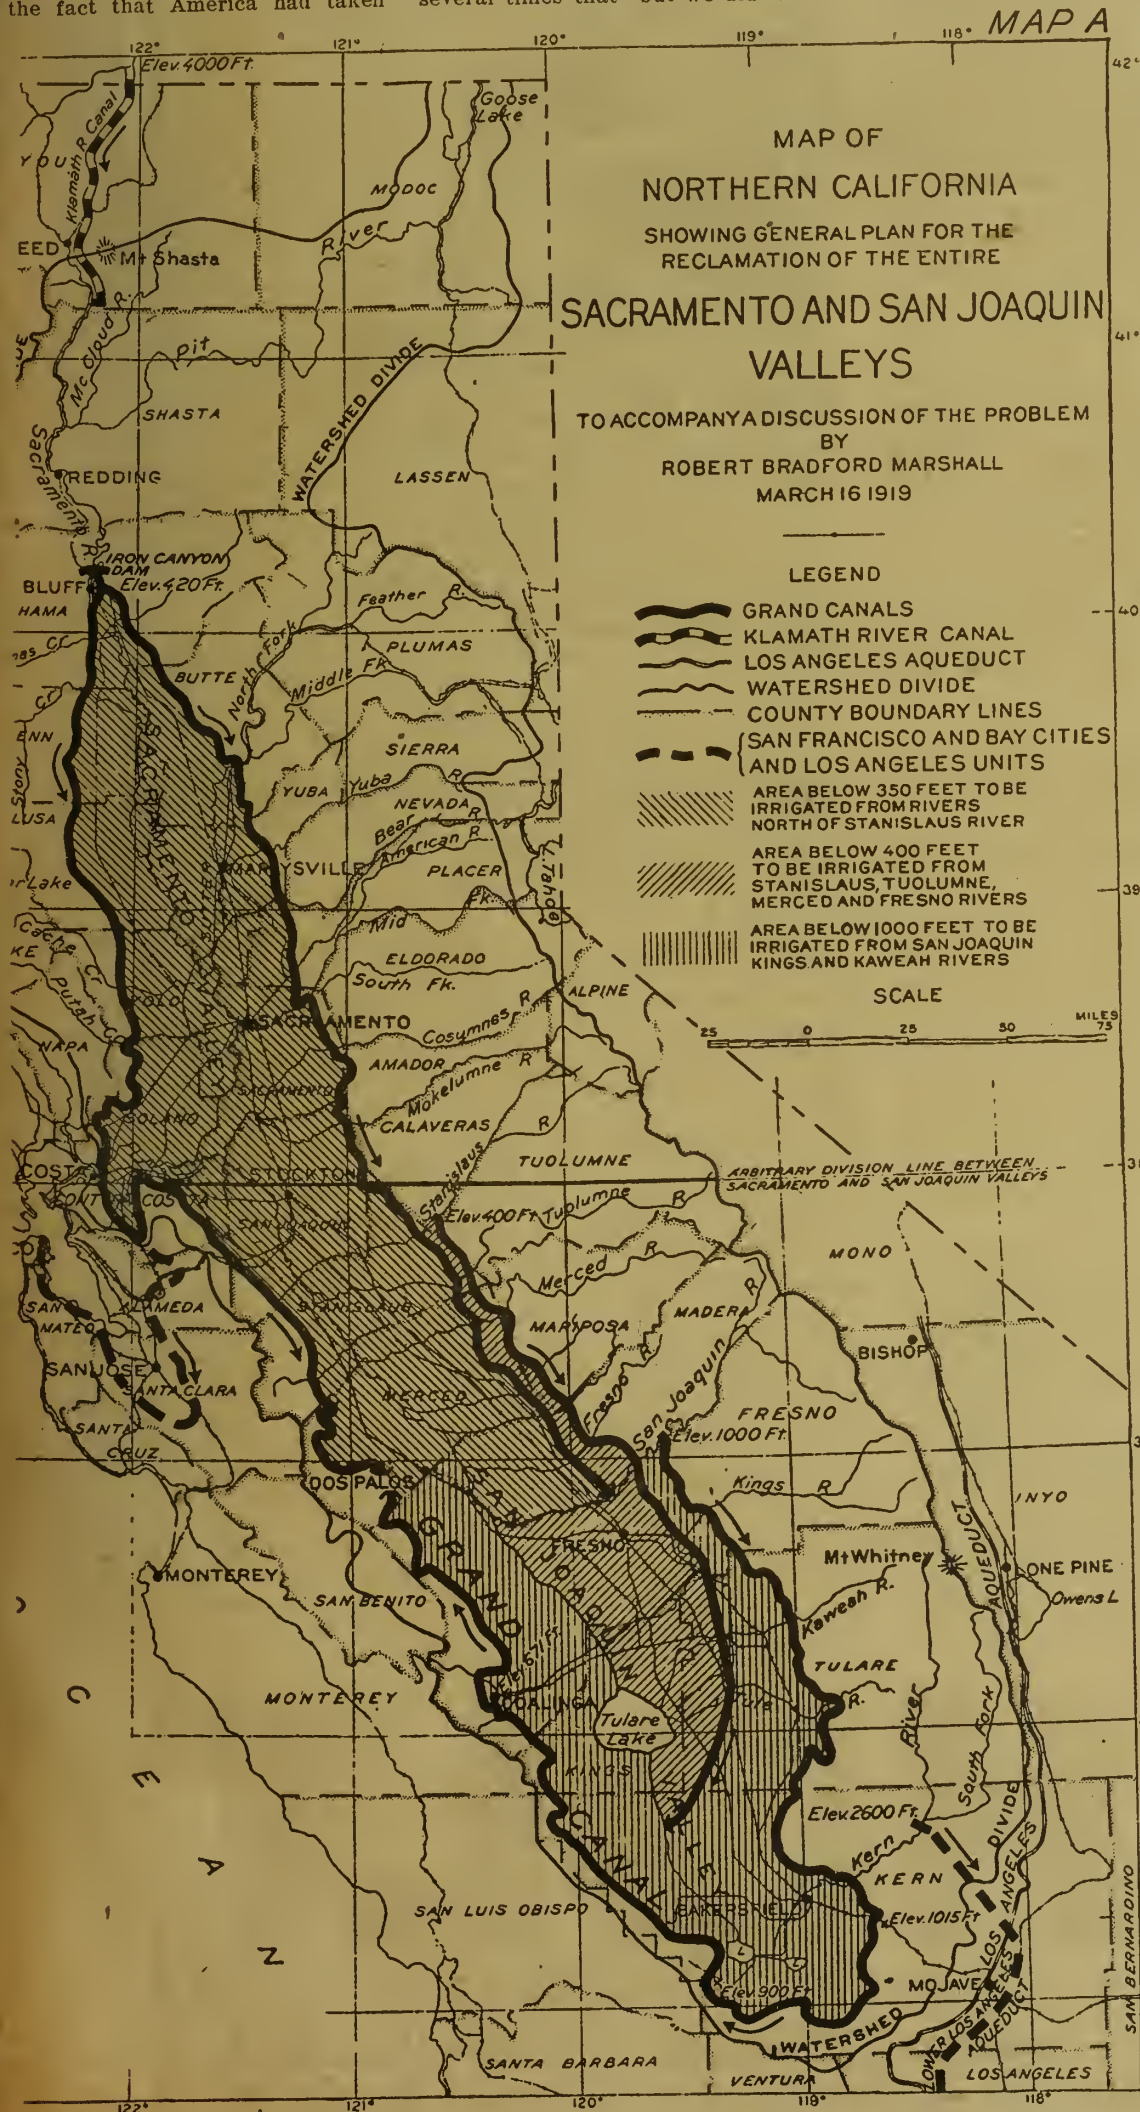

Complete solution of irrigation, power, flood, reclamation and navigation problems under one project.

Twelve million acres to be irrigated, providing homes for additional millions of people, increasing land values six billion dollars or more.

Vast power projects as storage and diversion produce new sites.

The outline map accompanying this article gives an excellent idea of the contemplated work in the great central valley and in the Klamath River section of the extreme north. Col. Marshall suggests that there is sufficient water in other rivers of the Sierra Nevada that it will be possible through building a great storage dam in the upper Kern River to supply water through a 33 mile tunnel to Southern California. This does not appear on the chart excepting at the headwaters of the Kern and the tunnel to the borders of Los Angeles County.

"Without vision the people perish."

Agricultural News Notes of the Pacific Coast

Northern California

The Placer County farm bureau has raised its annual dues to \$5.

The Balls Ferry farm center of Shasta County is planning to build a center hall.

The farm bureau expects to locate a poultry demonstration farm in Glenn County in the near future.

Farm Adviser Amundsen of Placer County recently gave pruning demonstrations in Auburn orchards.

The federal tariff commission announces that it will hold a hearing in California some time in February.

Farm Adviser Goatley of Glenn County will give a pruning demonstration in the Lake district on January 5.

The Placerville Fruit Growers Association of Eldorado County is purchasing power spray pumps for use of members.

The Sacramento Country farm bureau has devoted the month of December to an intensive campaign for new members.

Byron A. Nordyke, a stockman near Woodland, Yolo County, says he finds that sheep fatten like ducks on abandoned rice fields.

R. R. Lyding, poultryman of Sonoma County, reports entirely satisfactory results from prolonging the laying day by turning on the electric lights.

A Yolo County stockman has brought in 500 lambs from the ranges and turned them into a 60 acre rice field owned by him which was not worth harvesting.

The Mt. Pleasant center of the Placer County farm bureau at its recent annual meeting elected A. Isaak, director, and Mrs. F. N. Van Dyke, secretary-treasurer.

Proposed changes in the state fencing law to be brought before the coming legislature were discussed by the last meeting of the Anderson, Shasta County, farm bureau.

President Barrows of the state university has been appointed by President Wilson a member of the American Relief Committee to aid China in the present widespread famine.

At the end of the fifth week of the Sonoma County farm bureau egg laying contest at Petaluma, V. H. Guthrie of Petaluma stood at the head with a record of 208 eggs from his pen.

Japanese are said to be planning a campaign through their Japanese Christian churches to appeal to sympathies of other churches in their endeavor to secure California real estate.

Farm Adviser Talbot of Shasta County is laying out several check plots of alfalfa for experimenting with the use of lime, sulphur and a combination of lime and sulphur as fertilizers.

The state department of agriculture is asking the railroads to cooperate in safeguarding California agriculture from the entrance of four dangerous pests, the alfalfa weevil, the cotton boll weevil, the gypsy and browntail moths.

Sonoma and Napa County grape growers are endeavoring to secure extension of option on land now used by the federal department as a vineyard experiment station. Both counties are raising a fund to bear some of the initial expense.

Central California

The state's onion crop will total about 300,000 sacks.

Fig growers of Stanislaus County recently met and held pruning demonstration.

Oakdale, Stanislaus County, is planting to garden peas more than a thousand acres.

The Dinuba section of Tulare County shipped over 2,400 cars of fruit products during the past season.

Board of supervisors of Merced County has approved petition to organize the West Joaquin irrigation district. It will cover 208,000 acres.

Stanislaus County's hog raisers estimate saving to the producers \$11,500 because of selling fat hogs through their farm bureau auctions during the year 1920.

James Wilson at Cupertino claims the largest toyon (holly berry tree) in California. It is said to be the size of an ordinary live oak, no exact dimensions given.

Lindsay, Tulare County, found difficulty in accommodating its large number of citrus fruit workers. Over 500 were camped at one time on the city's free camping grounds.

Fresno built during the past summer six new drying plants, which cost in the neighborhood of \$30,000 each. It is expected that a number of others will be erected next season.

Kern County farm bureau members have been attending vine pruning demonstrations at Arvin, Weed Patch, Shafter, Wasco and Delano. Prof. Bielletti is giving the demonstration.

High school boys of Kern County propose to engage in a grapevine growing contest. The cuttings will be planted this season and the best root systems and thriftiest growth next fall will decide the winner.

Fresno County supervisors will be asked to call a special bond election for the erection of 14 memorial homes for ex-service men in Fresno County towns. The bond issue calls for the appropriation of \$950,000 through a special tax.

At the cattlemen's recent meeting in San Francisco a resolution was adopted calling for immediate action in the formation of a cooperative marketing association. The concern is to be financed with at least a quarter of a million dollars.

Modesto, Stanislaus County, is proposing to have a county fair. This calls for fair grounds, and at present there are three different sites under consideration. A committee is appointed which proposes to pull off a thoroughly representative fair next fall.

Beemen of Stanislaus, Merced and San Joaquin Counties met in annual session at Modesto and elected officers: M. L. Garber of Salida, president; H. E. Wolf of Stockton, first vice president; Earl Snider of Denair, second vice president; F. W. Burtch, secretary-manager.

Home department meetings of Kern County farm bureau were held this week at Shafter, McFarland, Arvin, Weed Patch and Inyo-Kern. Meetings next week at Kern Delta, Tuesday; Beardsley, Wednesday; Wasco, Thursday; Edlson-Fairfax, Friday; general county committee on Saturday, January 8, at Bakersfield.

Southern California

Lettuce growers of Imperial Valley will meet at Brawley this week.

The Riverside County farm bureau has decided to raise annual dues to \$3.

Independent bean buyers report making purchases of Limas at five and a quarter cents.

Japanese at Brawley are setting cantaloupes. A considerable acreage of tomatoes is also in.

Dairymen of the Garden Grove district met Thursday evening, December 16, at Garden Grove.

The board of trade of Indio, Riverside County, is urging necessity of building a packing house.

Palo Verde Valley producers have found profit in growing of Thompson Seedless and Malaga grapes.

Imperial Valley towns permit growers to sell their own products without securing vendor's license.

A conference of lemon growers was held in San Francisco, December 20, to discuss water freight for lemons.

The Imperial Valley Bankers Association has decided to support the Imperial Valley Growers Association.

The new community hall at Nuevo, Riverside County, was dedicated last week. Two hundred people were in attendance.

A demonstration of steam pressure cookers was given at Armada center by Mrs. Woodworth, Riverside County home demonstrator.

Prof. Overholser of the state university has been conducting a series of pruning demonstrations in Ventura County apricot orchards.

Sugar beet growers recently met at Santa Ana and signed up 600 acres in a marketing agreement. Campaign for larger membership will be pressed.

The Lima Bean Bulletin informs growers that not much change or improvement in the market is to be hoped for until after the first of the year.

The cannery at Santa Ana reports biggest run in its history. The pack was valued at over \$1,000,000. Of this nearly \$800,000 valuation was from pimentos.

Irrigators at San Dimas, Los Angeles County, are discussing flood control and conservation measures in the San Gabriel Canyon, which will cost approximately \$15,000,000.

Many growers in the Palo Verde Valley of Riverside County report signing contracts to plant vineyards and deliver grapes. Approximately two-thirds of the contracts call for planting of Malagas.

Horticultural commissioners and others interested in control of black scale met last week in Santa Paula, Ventura County, and found great promise in the new beneficial parasite *aphycus Lounsberryi*.

Riverside County farm bureau held its annual meeting in the new community hall at Nuevo, December 14, when the following officers were elected: Dr. H. S. Gordon, Nuevo, president; O. H. Cash, Perris, vice-president; Miss Irene Sausman, Riverside, secretary-treasurer; F. E. Collier, Mrs. J. E. Hench, George Thomas, Lester Bamberger, Mrs. H. E. De Nyse, O. K. Kelsey, C. K. Brown, directors at large.

The Coast and General

Aberdeen, Washington, has already shipped out 400 tons of salmon.

Skagit County, Washington, has a newly organized poultry association.

Plans are being made for a state department of agriculture in Montana.

Fair weather in Arizona cotton fields has favored harvesting operations.

The Klamath farm bureau of Oregon last year did a business totaling \$40,000.

The Oregon Poultry and Pet Stock Association held its annual at Portland, December 18.

Secretary of Agriculture Meredith opposes the proposal to increase grazing fees on national forests.

The annual convention of the Olive Oil Importers Association will be held in Atlantic City January 19-20.

Stock ranges of Arizona and western New Mexico have been given cold weather, with generally clear skies.

Thirteen Japanese societies in their native land have held a meeting and protested against anti-Japanese legislation in California.

The proposed Columbia Basin project will, it is said, be the largest irrigated area in the world. It will take in lands in Washington, Oregon, Idaho and Montana.

Secretary of Agriculture Meredith says that the falling prices of agricultural products creates a situation which should be dealt with as a national problem.

The U. S. department of agriculture has been conducting a big campaign on predatory animals in Arizona. In one drive at Flagstaff 340 coyotes were killed in ten days.

At the recent thirty-third annual convention of the Oregon State Horticultural Society at Eugene, the necessity of cooperative marketing was the principal topic discussed.

The American Honey Producers League convened in Chicago the first week in December. Representatives were present from apiarists of Canada, Mexico and South America.

Farmers of North Carolina have found that there is more than one way to dispose of their wool. About 15,000 pounds of wool has already been woven by them into blankets.

The Oregon Growers Cooperative Association shipped out 637 carloads of fresh fruits and berries during the months of July, August and September. The headquarters of the association is at Salem.

The U. S. weather bureau reports farming operations in dry land portions of Arizona have made little progress owing to exceedingly dry condition of soil. Seed is germinating slowly and cultivation delayed.

An appropriation of a million dollars is asked of congress by Secretary of Agriculture Meredith, to be used by the federal government in cooperation with the states in forestry work during the coming fiscal year.

Wheat growers of the Inland Empire met recently at Spokane to consider the serious marketing situation created by the slump in wheat prices. Farmers unions of eastern Washington and northern Idaho were well represented.

The Furrow-Manure System

By A. D. Shamel

THE cost of organic fertilizers for use in California citrus orchards, as compared with pre-war prices, shows large increases during recent years, particularly in the case of barnyard manure. Many other items concerned in the cost of producing and marketing the citrus crop have shown similar increases, and from the fact that the prices being received for some of these crops are low it becomes apparent to every thinking person that every essential feature of the cost of production must be considered with the utmost care by the growers. Inasmuch as organic fertilizer is one of the principal items of expense in growing citrus crops in many orchards, it seems logical that the cost and expense of applying such fertilizer, particularly in view of the present unsettled market conditions, should be considered from all possible points of view. The writer does not pretend to have any general knowledge of this subject, but does feel that his observations with regard to the economical use of barnyard manure, especially the applica-

tion of the furrow-manure method, may be of some interest.

The writer is deeply interested in and has described the use of the furrow-manure method in various agricultural publications during the past

several years. The first annual report of the California Citrus Institute issued June 1, 1920, contains two papers bearing upon this subject, one entitled "Application of the Furrow-Manure Method in Citrus Fertilization" and the other "The Conservation and Application of Manure." More than a year has elapsed since the preparation of the above mentioned papers, and it seems desirable to present to the readers of the Cultivator additional observations upon the use of this method.

What Is the Furrow-Manure Method?

The furrow-manure method may be described as the burying of manure or other fertilizers in shallow trenches or furrows. The object is to apply the fertilizer near the feeding root zone in such a way that it can be promptly covered. This method should be clearly differentiated from trenching as it is usually understood. The term "trenching" is frequently used to define the digging of deep trenches or pits, while the term "furrow-manure" should be confined to the plow made furrows or ditches of comparatively shallow depth. As pointed out in previous publications, the writer evolved this idea as a result of his observations in Navel orange orchards in the vicinity of Bahia, Brazil, in 1913. In those orchards manure was found to be the principal fertilizer used, and it was applied, as a rule, in shallow pits near the drip of the branches of the trees. As no horse or tractor drawn implements were found in these orchards and as hand

labor was cheap, costing about 30 cents for a full day's work, this method of applying manure was the logical one.

In California, however, with comparatively high priced labor and with animal or power drawn plows in general use, it seemed to the writer that a modification of the Brazilian method might prove to be of value. With the cooperation of one of the leading citrus growers in the Corona district a small plot was devoted to the following experiment: Furrows were made midway between the tree rows. These furrows were from six to eight inches deep and arranged in the same direction as the irrigation furrows. They were the back furrows left after plowing in which an extra round with an ordinary 16 inch orchard plow was made in order to widen and deepen them. At the time that the manure was distributed in these furrows at the rate of about ten cubic feet per tree a similar amount was broadcasted and plowed under on the balance of the orchard. The results of this experiment were clear cut and definite and the beneficial effect of the furrow-manure treatment was so decided as to admit of but one conclusion, viz., that it was much more efficient in improving tree conditions in this experiment than the broadcast system. Impartial study of this plot and the comparative orchard by scientists, citrus growers and others confirmed this conclusion in every respect, as did subsequent individual tree records of production.

As a result of this very striking demonstration many neighboring citrus

(Continued on Page 824.)

Making manure furrow with plow arranged for this purpose.

Agricultural Progress in Arizona

By M. E. Bemis

AGRICULTURAL development in Arizona during the last decade has been so rapid and its success so marked that in relative importance it has crept up from a minor place to second in importance in valuation of property and in production. As measured by dollars and cents, mining holds first place and agriculture second. Cattle growing and sheep growing have third and fourth place.

The acreage of irrigated land in Arizona at the present time is nearly 500,000, and by far the greater proportion of this (about 300,000 acres) is in Maricopa County. The other leading agricultural counties are Yuma, with irrigated acreage of 43,000; Graham, 27,000; Pinal, 43,000; and Pima, 29,000. Several other counties have more or less extensive irrigation projects either completed or partly completed. This is particularly true of Apache County, where the Lyman dam is just now being completed.

Early irrigation in Arizona as well as other parts of the Southwest was, as compared with modern irrigation, somewhat crude. The early settlers were largely cattlemen. Irrigation to them was merely incidental to cattle raising. Brush and stone dams and more or less inexpensive canals enabled them to grow a crop of grain or a summer crop of sorghum and, in the later years of the cattle grower's regime, alfalfa.

The first really big irrigation enterprise in Arizona was undoubtedly that of the Salt River Valley, and the first

work on this was a little more than 50 years ago. This proved to be a big success, although grain and sorghum were the principal crops at first. In the later years alfalfa was added and made a splendid success. It was also found that fruits and vegetables, and in fact so many crops, would do well that settlement was rapid. History then proceeded to repeat itself, that is to say, more land was under the plow than there was water for the land. Consequently there was not the progress that the early successes indicated, and it was not until the completion of the Roosevelt dam a little more than ten years ago that the dreams of the early settlers began to be realized.

The success of the Salt River project has been so marked that other irrigation projects have been patterned after it, and it has been the inspiration for other projects which have been completed or which are now contemplated.

Looking over the vast field of possibility it would seem that our 500,000 acres of irrigated land is only a beginning of what we may expect within the next decade. Curiously, Arizona is the fifth state in the Union in area and is drained almost entirely by one river system, the Colorado. The small area which is excepted is in the north-eastern part of the state where a few streams flow into Utah and Colorado.

EDITORIALETTES

Flowing water gives to the Californian a feeling similar to that which we believe a man by the name of Marshall once had when he saw the glittering nugget at Sutter's Mill, and perhaps it is fitting that another Marshall should now come and convince us of greater wealth than we had imagined in flowing water. In any case, it's a wonderfully attractive scene on the cover of this issue, and in this number there is much which calls attention to Col. Marshall's great scheme and to the wealth making power of California waters. This particular scene is on the system of the Fontana Company and shows an overflow box which regulates pressure.

* * *

It will be many years before California will see the working out of the details of the great irrigation scheme which will mean so much to Central California, but its very magnitude and apparent impossibility stir one's imagination to the extent that one involuntarily remarks: "Let's do it." When one thinks of storing the winter's floods of the Feather River, carrying them around the north and west side of the valley, dropping an inverted siphon under Carquinez Straits, then up on the hills above Port Costa, around the bay into San Francisco, and again farther down the valley even

to Crows Landing, and then realizes that this is only a small feature of the great irrigation scheme, it impresses with its bigness.

* * *

Meantime the duty of such water as is now available for irrigation must be increased. This can be done through lining of canals with concrete and the use of concrete pipes and division gates to a greater extent.

* * *

There are meters, division gates, surface pipes, improved implements for preparing ground for irrigation, almost without number, and these are saving, not only in water, but in labor. We do not think the state has ever seen improvement so rapid along this line as during the past two years.

* * *

History is repeating itself back in Kansas. Corn is proving cheaper than coal as a fuel, and as a result thousands of tons of fine grain is going into the furnaces back in Kansas. It seems unwise; it seems almost wicked, but we doubt not if we lived in Kansas and had been raising corn we would likewise be making fuel of it rather than getting hot over the fact

NINETEEN TONS OF MILK FROM ONE COW IN ONE YEAR

Wire received just as press starts:

"Segis Pietertje Prospect a Holstein cow owned by Carnation Stock Farms, Seattle, Washington has broken the world's record for milk production with thirty-seven thousand three hundred and forty-eight and one-tenth pounds in three hundred sixty-five days exceeding Tilly Alcartra by three thousand nine hundred fifty-eight pounds."

that it makes money faster that way than by feeding to hogs for the benefit of the packers.

* * *

Speaking of burning corn, why not grow our fuel in a more satisfactory way—we now mean we of California—and plant a eucalyptus tree? A good big Christmas backlog in the fireplace adds a wonderful amount of cheer, enough, we believe, to justify even the owners of smaller tracts of land in utilizing a waste place or an out of the way corner by growing this tree which gives the greatest amount of wood within a given time of any tree on earth.

* * *

Wood is selling in Los Angeles now at \$32 per cord. Such prices are resulting in forsaking the fireplace and installing gas and oil heaters. They supply the warmth but lack in giving the homey feeling of the old time fireplace.

* * *

If one has no need of following the Roosevelt plan of securing a bit of exercise at the woodpile, there are several excellent power saws which make the working up of wood a very profitable occupation. We are not urging a return to the eucalyptus craze of a few years ago, but be sensible and plant a few trees for fuel, posts and numberless other farm uses.

* * *

The farm bureau in its recent meeting in Indianapolis fired some hot shot into the transportation act now before congress, which proposes to guarantee railroads an assured income of six per cent, or perhaps only 5½. It is perhaps logical that the railroads which were guaranteed, not only against loss, but a definite income during the war, should wish these guarantees continued. Shipbuilders and some manufacturers were also given guarantees, and, unfortunately, this "guaranteed class" is so numerous that they are having a strong pull, even a push, with the legislators. So the

farm bureau is getting busy and it points out the fact that it has been conceded that the railroads are figuring on a basis some six or seven billions in excess of actual selling valuation in their effort to secure this enormous amount of "pork." In the name of all that's good, why pile this burden on top of the farmers, thousands of whom are today being ruined, largely, at least, because of the enormous transportation charges.

* * *

The total consumption of wool by manufacturers during the month of August was 38,000,000 pounds. This was 18,000,000 pounds less than during the same month of 1919 and the proportion of high grade wool used during the present year is less than that of former years by a much greater figure. Meantime we note in a northern exchange that sheep owners are driving sheep onto winter range without shearing: "For the first time in the history of sheep raising in this part of the state there was no fall shearing this year. No shearing was done with the exception of lambs. The high prices demanded by the shearers, who had formed a combination and held out

are continually flowing into the sea, but not a drop ever flows from it nor is it ever given up except under the fierce demand of the desert sun. For ages this has continued until the sea contains not one form of life; no one ever camps by it; never does a bird haunt its shores, and only bleakest of desert wastes surround it.

The other sea, much smaller, named Galilee, has grass covered slopes surrounding it; violets and daffodils blossom almost to the rippling edge; its waters are filled with myriads of fish-birds everywhere; it is a living sea. As with the Dead Sea, its waters are all from the Jordan. The difference in their character is explained by the fact that the smaller northern sea is continually giving up that which it receives.

Of course Mr. Dixon then moralized on human beings who made a perfect parallel with either the small body of living water or with the larger body of dead water. Lots of people in this world who can still walk are dead ones. They add little to the happiness or the advancement of the world.

The New Year is a good time to give a bit of ourselves and pass on something of happiness to others. At least we can buy an almanac and learn a few jokes.

WAGE SCHEDULE

The Valley Fruit Growers Association, which is a big factor in arranging for labor and its compensation in the San Joaquin Valley, has made a radical downward revision of wage schedule for fruit and other workers. There are thousands of idle men whom fruit growers have felt unable to employ simply because fruit prices would not justify continuance of production with present wage schedule. So the association has named new wages as follows: Pruning trees and vines, Japanese, Hindus and Mexicans, 45 cents; Americans, 50 cents. Americans, with board per day, \$3 or \$3.25 according to length of job. Laborers and teamsters, \$2.50 and board or \$60 per month and board.

"It is the hope of the directors of the Valley Fruit Growers Association that with the publication of these prices for labor and pruning the growers will immediately take advantage of the readjustment of the wage scale, which has been gone into most carefully by the directors of the association. A large number of capable and experienced ranch hands and pruners, in crews or single men, are available."

ALKALI IMPREGNATED WATER

The writer recently made an auto trip to San Francisco and return, going by the interior route and returning by the coast route. One of the impressions firmly fastened on the mind is the extreme prevalence of alkali lands throughout the state, an evil which must be guarded against. This is especially true of such crops as the citrus. It is risky to attempt to irrigate citrus orchards from wells that obtain their water from the country drainage. We have glaring examples of this right at home at Riverside. Orchards that have shifted from ditch water to well water after they had a good start have deteriorated to an alarming degree.

The experiment station authorities are investigating the conditions and will doubtless report progress on their work if they have not already done so. But this warning cannot be too much dwelt upon. Corona tried the Elsinore Lake water at the cost of almost ruin. Wells are in use in many places that should never be used for irrigation purposes. It does not become apparent at first. It may be several years before the alkali accumulates sufficiently to make its effects apparent. This makes the situation all the more dangerous, as it takes a long time to get trees back to normal after the soil has once been poisoned in this way.—K.

HAPPY NEW YEAR

There is a whole lot of happiness in the world. Let us wish it on each other more than ever before in our lives at this glad New Year time. And it is a glad New Year time notwithstanding there are so many appeals that even heartstrings are more or less rent. There were never so many calls upon us to be of service. Therein may come the happiness for the rest of us.

If we may be pardoned for a bit of moralizing in a story, we will tell one we heard the other day from a preacher named Dixon who succeeded Spurgeon in his Tabernacle in London. The story had to do with the Dead Sea and another smaller body of water to the north. The waters of the Jordan

TREES AND VINES

**June Bud Peach Trees
Number One Grade**

In addition to our usual stock of yearling trees, we propagated 250,000 June Budded Trees this season.

The Planting Season Is at Hand

The supply of trees and vines for orchard and vineyard planting will doubtless be exhausted before long.

The greater part of our nursery stock for this season's delivery is grading up very satisfactory and we are accepting orders for immediate delivery.

If we may quote you on your requirements send request immediately, giving information regarding quantities and varieties wanted.

Southern California orders for Grape Vines must reach us prior to January 1st. (Do not ask for Wine Grape rootings as we have none in stock.)

We have all told over four million trees and vines in our several Nursery Plants for California of commercial varieties of drying, shipping and canning fruits and grapes.

We have been at it in California for THIRTY-TWO years.

We endeavor to please and hold every customer.

FIGS

Our splendid stock of Fig trees are grown in the FROSTLESS BELT OF TULARE COUNTY thereby insuring our customers that the trees are in a thrifty, healthy condition.

We make a specialty of growing the famous K A D O T A FIG.

It is a rapid grower; precocious bearer and a superior fig for canning, preserving and also for fresh shipping.

We can also supply all the other leading varieties.

Let us figure with you on your wants

THOMPSON SEEDLESS GRAPES

The California Associated Raisin Company has been the means of placing the Raisin industry of the State upon a paying basis.

Apparent to all planters is the value of the well known

Thompson Seedless

Its adaptability to a wide range of soils and climatic conditions together with its enormous bearing qualities makes it a popular shipping and raisin variety.

Our stock of all the leading commercial varieties is complete.

**Thompson Seedless
Number One Vines**

Our Grape Vines grown in Madera, Fresno and Tulare Counties are unexcelled

The size of your crop depends on what you do now

The size and quality of your next fruit crop is being determined now by the condition of your soil.

Vital elements necessary to the success of the crop lie dormant—potash—nitrogen—phosphorus. Other equally important elements—sulphur and calcium—have been exhausted.

AGRI Gypsum will release these latent possibilities of your land and give it new life and fertility, when used as a root fertilizer and as a stimulant for luxurious cover crops.

AGRI Gypsum is a specially selected, specially ground and specially prepared Gypsum rock. A poor agricultural gypsum is not of much benefit; AGRI Gypsum is a remarkable fertilizer.

.. FRESNO, CALIFORNIA ..

THE FURROW-MANURE METHOD

(Continued from Page 821.)

growers and those from a distance who visited this plat tried out this method on a large commercial scale in their orchards. Six years have passed since then. The method has been tested under practically every condition in the citrus growing districts. It has also been extensively used in applying fertilizers in vineyards, deciduous fruit orchards and elsewhere. The writer wishes to emphasize the fact that he has no reason for advocating the use of this method, or a trial of it, other than the hope that it may prove to be valuable and a real service to those concerned. He does not wish to convey the impression that it is the only method by which organic fertilizers can be successfully applied in citrus orchards or elsewhere. At the same time he has been profoundly impressed with its apparent value and usefulness and cannot help calling the attention

It is kept moist during the irrigation period. This is usually accomplished by locating the manure furrows so that the irrigation furrows run alongside. In this way the water in the irrigation furrows supplies naturally the essential moisture to the buried manure. For some unexplained reason it seems that when the irrigation water is run directly over the top of the manure furrows the results are not as satisfactory as when the water is run alongside the manure furrows. On the other hand, good results have been repeatedly observed where the manure is buried in furrows run at right angles to the irrigation furrows in such a way that the irrigation water passes down into the buried manure. In these cases the moistened manure furrows have been frequently followed in the spaces between the trees and where the irrigation furrows are not established.

In the second place, deeply buried manure has not given as beneficial results as that in shallow furrows. The

Furrow Manuring in Orange Orchard

Furrow about eight inches deep, with manure distributed at the rate of about five cubic feet per tree.

of all interested persons to the results which have been obtained from its use.

A few apparent exceptions to the almost universal testimony as to the value of this method have come to the writer's attention. The writer has had no opportunity to investigate these reports; furthermore, he has had no facilities for carrying on any other experiments than the original one. It may be, as is usually the case with the general application of any method of farm practice with which the writer is familiar, that under some soil or other conditions this method does not give as satisfactory results as the broadcast system. Further experience will prove the limitations of the furrow-manure method, but to date it has been an almost universal success according to the reports the writer has received from the users. It may be that in the two or three cases in question the application of the method was such as to prevent the development of the beneficial results usually observed. There are several fundamental factors, in the writer's opinion, which must be carefully observed, otherwise unfavorable results are likely to be obtained.

In the first place, the buried manure in the furrows must be so placed that

writer has studied this condition many times and observed this result in every case investigated, but is unable to offer an explanation as to the cause of this condition. The best results have been found where the manure has been buried in furrows from six to eight inches deep.

In the third place, the season of application of the manure in furrows has seemed to have an important bearing upon the results. While the season of application depends frequently upon local conditions and must be governed somewhat by them, the best results seem to have been obtained, in the writer's observations, when the manure was applied during the late summer and early winter months. This result may vary, depending upon local conditions, and probably does, and the writer has some evidence to this effect, yet the general conclusion in this respect remains as stated.

In the fourth place, it seems apparent from our observations that fresh stable manure applied in the furrows gives better results than decomposed or composted manure. This condition has been explained, whether justly or not the writer is unable to say, on the basis that the decomposition of the manure in the soil is beneficial in it-

self aside from the plant food value of the fertilizer.

Applying the Method

There are several well known implement companies in California that now furnish admirable equipment for applying this method. In particular, plows adapted for making suitable furrows with once through are now available for those who desire to use them. In covering the manure several generally used implements have been adapted for this purpose, which usually simplify and reduce the expense of this feature of the method. One implement for this purpose is a two shovel cultivator, usually drawn by one animal, with the shovels set at the proper angle and spaced according to the width of the manure furrow, which covers the manure satisfactorily and leaves suitable furrows for irrigation purposes alongside the buried manure. No one as yet, in the writer's knowledge, has put on the market a wagon or manure distributor which will automatically throw the manure into the furrows. Such an implement is needed and the writer hopes that some of our progressive implement makers will soon supply the demand for such a machine.

The beginner may well try this method by making the furrows about six inches deep, locate them near the drip of the branches of the trees and in the same direction as the flow of irrigation water. The manure should be covered soon after it has been distributed, the same day if possible. It should be spread in the furrows at least as far as the branches reach on both sides of the tree trunks. In older orchards where the branches nearly meet in the rows, it would be advisable to fill the entire length of the furrows. With smaller trees it seems probable that it is not necessary to fill all of the furrows and is more desirable to bunch the manure alongside the trees.

Reasons for Using Furrow Manure Method

One of the chief reasons for using this method is the competent testimony of many successful orchardists, covering a period of at least five years, that five cubic feet of manure applied in the furrows gives as good or better results than ten cubic feet broadcasted.

Another reason is that it is practicable to cover the manure promptly in the furrows, thus avoiding the loss of nitrogen which frequently occurs when manure is broadcasted and allowed to lie exposed to the air for some time before it is covered.

Another reason is that the fertilizer in the furrows can be placed directly in or near the feeding root zone of the trees, where it seems logical that it must be most efficient. Furthermore, age long experience seems to indicate that bunched manure is to be preferred to a thinly spread condition for tree feeding purposes. If it is necessary to improve the entire soil condition, it may well be that better results in this respect will be obtained by broadcasting the manure. This contention is sometimes made and the writer is unable to offer any opinion in regard to it other than it seems to be a reasonable one.

The writer has watched for several years with keen interest the use of this method in the bringing up or the improvement of citrus orchards in poor physical condition. There has not been a single exception in these observations to the very apparent beneficial results from its use. These instances have occurred under widely different conditions and in different districts. The results are extremely striking and worthy of inspection and careful study by those who are in doubt as to the practicability or value of this method. They include very large, medium and small sized orchards, old and young trees, all commercial varieties of the citrus and all important soil types.

A recent investigation of Satsuma orange orchard conditions in southern Alabama revealed the fact that this method is being used there with as apparently beneficial results as have been observed in California. Correspondence with several citrus growers in foreign countries indicates that this method has recently been introduced there successfully.

In conclusion the writer wishes to

offer his opinion that the citrus grower can well afford to try this method as a means for applying manure in his orchard in an economical, practical and efficient manner.

AGRICULTURAL PROGRESS IN ARIZONA

(Continued from Page 821.)

The principal tributaries of the Colorado are the Gila and Little Colorado. Beginning with the Gila, which rises in New Mexico, there is found to be a reservoir site in New Mexico which will irrigate a considerable area of land in Eastern Arizona. Farther down on the Gila the Mormon settlers in Graham County very shortly after the settlement of the Salt River Valley developed irrigation on the Gila and built up the towns of Safford, Sol-

omonville, Thatcher and one or two other small places. This irrigation project, as compared to our Salt River Valley, is small in area, but has been very successful, especially so in the production of alfalfa, grain and fruits. There is contemplated a reorganization of several canal companies of this district into a water users association to establish reservoirs which will extend the area of irrigated land in this county.

In the vicinity of Florence irrigation is older than in the Salt River Valley. There is a reservoir site above Florence about 75 miles, known as the San Carlos site. If a reservoir is built here it is believed that sufficient water will be stored to irrigate possibly 200,000 acres of land in Florence and Casa Grande Valley. A small area of land is already under irrigation at the present time. Also a small area in close

proximity at the Pima Indian reservation near Sacaton. Irrigation by pumping is reaching a greater degree of success in the Casa Grande Valley than any other section.

At Yuma new land is being opened on the fertile Yuma Mesa. Development here has already begun and during the next year it is almost certain that the area of irrigated land in the Yuma Valley will be greatly increased.

About 15 miles west of Phoenix, a little west of the junction of the Gila and Salt, there is an irrigated section of probably 30,000 acres which is irrigated from the Gila. The drainage from the great irrigation project of the Salt River Valley helps to maintain an even flow in the Gila and there is always plenty of water, although there is no reservoir. Farther on a dam is being built which will, it is believed, irrigate approximately 75,000

REPUTATION

The Best Tracklayer Sixty Tractor has built a reputation for stamina, reliable power and low up-keep. This reputation so closely guarded by the manufacturer has been due to the quality of material used, the proven design and the knowledge of tractor requirements which has been gained through years of experience in the actual building of tractors and the incorporating of modern improvements in each new model.

The "Sixty" was too powerful for all uses; so, upon the demand of farmer, orchardist, contractor, in fact all lines of industry where tractors are employed, the factory has perfected a model to be known as the Best Tracklayer Thirty Tractor, in which has been incorporated all of the experience of the manufacturer as to design, etc., together with all of the reliable improvements of the age. The "Thirty" is years ahead of any other tractor on the market.

Delivery date on this new model "Thirty"
About February 1st, 1921. Send for circular.

C. L. BEST TRACTOR CO.

SAN LEANDRO

CALIFORNIA

Best Tractors

acres. There are scattered areas in other districts along the Gila between Gila Bend and Yuma that are irrigated. The possibilities for further development are good but as yet somewhat indefinite.

In the southern part of the state on the Santa Cruz River in the vicinity of Tucson there are several irrigation projects, partly gravity and partly pumping proposition, which have reclaimed a considerable area of choice lands.

In the northern part of the state, as before mentioned, the Lyman dam will irrigate a considerable area. In the vicinity of Winslow on the Little Colorado River there is an irrigation project under contemplation which will add much to the areas of irrigated land on the Little Colorado. In the extreme northern part of the state, in what is known as the Arizona strip, there are areas which will be brought into irrigation at some future time. The one most talked of at the present time is the one on the Virgin River.

In the Salt River Valley, in addition to the lands already supplied with water, there is almost certain to be

great development in the next few years. The Paradise Valley Land Owners have been granted permits to build dams in the Verde River, and the area of land which will be irrigated is 75,000 to 90,000 acres. Further conservation of the waters of the Roosevelt dam, together with the dam which is contemplated on the Salt River at Mormon Flats between Roosevelt and Granite Reef dam will permit of the irrigation of several thousand acres east of the present boundary of the project.

The Southwest Cotton Company has developed, largely by pumping with power furnished from the power houses of the Salt River Valley project, some 25,000 acres of land. These projects which have been mentioned will, when completed, double and perhaps treble the irrigated area of Arizona.

One big irrigation project, that of the Colorado, which is now only tentatively planned, will be perhaps the greatest in the world. Honorable C. M. Zander, member of the state tax commission for the past several years and one of the best posted men in the

state, has said of this project: "The Colorado will appeal to the imagination of the nation more than will the Mississippi because here can be put on a realistic play enacting the scenes of 5,000 years ago on the Euphrates and the Nile, because a desolation will be changed into an empire, a waste into a paradise, a Garden of Eden rediscovered that may usher in the millennium as it first ushered the advent of man. Part of May and June there were 170,000 second feet of water rolling to the sea. During the year, if properly conserved behind reservoir dams, enough water is carried by this river to irrigate two million acres of land, to generate a million horsepower of electric energy and in addition to supply a regulated flow sufficient for navigation from Yuma to Wyoming. Arizona's proportion of all these benefits should be at least one-half."

One who has watched the development of irrigation, and after looking over the immense area of desert land, turns and sees the unhampered floods of water rushing down to the sea to waste, only begins to dream of what the future holds for Arizona and other

parts of the Southwest. In soil and in sunshine there is no part of the world that can claim superiority. The water is the one element that is needed, and the water that is annually flowing to waste is sufficient, if conserved, to make over this part of the world into an agricultural paradise and to offer homes to the thousands of people who have a real honest desire to get back to the land and live that independent life that real Americans desire to live.

HOW A WATER FILING OR APPROPRIATION IS MADE

By W. A. Johnstone, Commissioner

THE doctrine of appropriation is one recognized in the law of waters as governing a class of rights that grew out of the occupancy of the public domain during the mining period. Although comparatively recent, it represents a very ancient practice in Western America. This is well stated in the well known case of Clough vs. Wing (2 Arizona 371), wherein the court says:

"And the right to appropriate and use water for irrigation has been recognized longer than history, and since earlier times than tradition. Evidences of it are to be found all over Arizona and New Mexico in the ancient canals of a prehistoric people, who once composed a dense and highly civilized population. These canals are now plainly marked, and some modern canals follow the track and use the work of this forgotten people. The native tribes, the Pimas and Papagos and other pueblo Indians, now, as they for generations have done, appropriate and use the waters of these streams in husbandry, and sacredly recognize the rights acquired by long use, and no right of a riparian owner is thought of. The only right in water is found in the right to conduct the same through their canals to their fields, there to use the same in irrigation. The same was found to prevail in Mexico among the Aztecs, the Toltecs, the Yaquis and other tribes at the time of the conquest, and remained undisturbed in the jurisprudence of that country until now."

The courts first recognized this doctrine and in 1872 the California legislature enacted 13 short sections (see 1410-1422 Civil Code) governing the acquisition of such rights, and these have held with slight changes until December 19, 1914, when the water commission act, passed by the 1913 legislature, was approved by all the people of the state upon a referendum

Applications

The new law provided a fairly complete water code under which the state now supervises the acquiring of new rights and maintains a complete record for the benefit of the appropriator and the public in the main office of the state water commission at San Francisco. The new law did not change the basic principles but did abrogate the old sections. The water commission has a number of other very important functions, such as the determination of old rights acquired under the earlier law, studies of available water supplies and storage sites, etc., and as an informal court or as referee in water litigation.

To acquire a water right under the new law it is necessary for the applicant to file an application with the state water commission, setting out the name and address of applicant, source of water, place of diversion, purpose for which it is to be used, place of use, and general description of the works to be installed. Priority is fixed as of the time of the filing of the application with the commission. For the purpose of protecting the priority of the applicant he need not file a complete application at the outset, but must give his name, the maximum amount of water called for, purpose of use and source and point of diversion. The commission has authority to give reasonable extensions of time for surveys, etc., necessary to give the full information required. The statute requires that a filing fee of \$5 be sent with the application, and a small permit fee is collected when a permit is issued.

The act provides that separate applications must be made for the following uses: irrigation, power, mining, municipal and storage and adds that water for domestic uses may be asked

Greetings!

"The World Over"

TO you, our legion of friends, old and new,
we send our heartiest Yuletide greetings.

In the rich farm lands of the United States, in Canadian wheat fields, on the wide plains of South America and Europe—wherever Case Machinery has gone, there we count our friends.

To you who toil in these fields, year by year bringing from the soil life and strength for your nation, we owe our greatest debt. For seventy-nine years we have striven to make your task easier, your work more joyous.

In a spirit of warm friendliness and rejoicing, we wish you the age-old, "Merry Christmas".

J. I. Case Threshing Machine Company
Racine, Wis.

for with any of the above uses. The commission has recognized applications for a permit for manufacturing purposes in addition to the above.

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards six times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand and Fleur de Soufre, packed in double sacks, are the fluffiest

and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men \$5 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill into the soil 220 POUNDS PER ACRE of TORO BRAND SPECIALLY PREPARED AGRICULTURAL SULPHUR—or our DIAMOND "S" BRAND REFINED POWDERED SULPHUR. This soil treatment has increased various crops up to 500%. Send for Circulars No. 6, 7 and 8.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur, Mixtures, etc.

Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR CO.
624 California Street, San Francisco, Cal.

We are equipped to make immediate shipments. Send for Price-list and Samples.

Ask us for prices for Carbon Bisulphide, the surest remedy for destroying ground squirrels.

Bartlett Pear on Japan Roots

We still have some fine Bartlett as well as Bosc, Anjou, Comice, Flemish Beauty, Winter Nellis and other leading varieties of pears on Japan Pear roots.

These trees are grown on new soil never before in nursery stock, are well rooted, clean, healthy and hardy.

Hundreds of thousands of our trees in all parts of the West are now bearing profitable crops for their discerning owners.

We also carry a complete line of general nursery stock, all of which is guaranteed to please you. Remember our prices cover freight and packing charges.

PROTECT PRUNING CUTS

Tree cuts or wounds, if left exposed, are very likely to become infected. Prevent infection by prompt application of PABCO PRUNING PASTE. Ask your dealer. Manufactured by the Paraffine Companies, Inc., San Francisco, California.—Adv.

Permits

When the application is received in proper form with the maps required it is advertised by four publications in the paper nearest the user for four weekly publications, or in some cases notices are posted in the nearest post-office. After the notice has run 60 days is allowed for the filing of protests and objections. If no protest is made, and there is a reasonable showing of water being available, the commission issues a permit, fixing the amount, use, time for beginning construction, time to complete the system, and time to completely put the water to the proposed use. The commission maintains a certain supervision over the construction and has authority for good cause shown to give proper extensions of time.

License

After construction has been completed, an inspection made, and when the water has been fully applied, and so shown, the commission issues a license which becomes the applicant's evidence of title so long as he maintains his right by use. The water commission act provides that three years non-use of the water right constitutes a forfeiture of the right. Heretofore, the courts, in the absence of state law, have held that five years non-use had the same effect.

BRIEF OBSERVATIONS ON WINTER IRRIGATION OF CITRUS

By Jas. D. Culbertson

BECAUSE the winter months in California constitute the so-called "rainy season," all too frequently the question of irrigation is dropped from the calendar from October to April. Many a citrus grower takes it for granted that it will rain enough to maintain the trees, and when it does rain half an inch or so, he looks at the ground about the trees and underneath the cover crop, sees it damp, and concludes that all is well.

During the ordinary winter weather evaporation of moisture from the soil and transpiration of moisture from the foliage of the tree are greatly reduced, but where there is a vigorous cover crop it often uses moisture far in excess of these savings.

Winter rains can take the place of orchard irrigation only when they penetrate well into the soil mass occupied by the feeding root systems.

On most soils there is no need in the winter for such frequent or copious irrigations as during the summer, even if there is no rainfall, but the grower of oranges or lemons who prizes quality and quantity in his yields will keep his finger on the moisture pulse of his soil to see that it does not fall to the wilting point, or below.

If trees are allowed to wilt much of the fruit is prematurely dwarfed and tends to ripen early.

As the rainy season approaches, however, it is extremely desirable to have the orchards in such condition that they will absorb as much as possible of the precious rain water, not only because it costs nothing, but more especially because it falls uniformly over the entire area of soil and carries down into the root zone the soluble nutrients that accumulate near the surface during summer cultivation and irrigation.

Furthermore, on soils tending toward alkali accumulations, an abundant absorption of rain frequently leaches out large quantities of injurious salts that are not easily displaced by the irrigation water.

In order to have the orchard soils always capable of absorbing generous quantities of rainfall, the winter irrigations should be lighter. This can be accomplished, usually, either by keeping the water in the furrows a shorter time, or by irrigating only half of the furrows, or by both methods.

Like so many other orchard problems, the question of proper winter irrigation depends for its proper solution by each grower on knowing the actual condition of the soil. This means thorough and frequent soil moisture observations to a sufficient depth to reveal the conditions where the roots are feeding.

It is proposed to increase the capacity of Lake Hemet by raising the dam 20 feet.

TOP-DRESSING TALK No. 3

100% Increase in Orange Crop

Mr. R. L. Wells, Rialto, San Bernardino County, Cal., applied *Arcadian Sulphate of Ammonia* to a portion of his orange grove. The rate of application was four pounds per tree in two installments of two pounds each. The material was scattered in the basin March 1st and April 1st, each time just previous to an irrigation. This was in 1917, but due to hot winds there was no crop that year.

In 1918 the trees receiving *Arcadian Sulphate of Ammonia* produced at the rate of 648 field boxes per acre, while those without *Arcadian* yielded only 324 field boxes per acre. Estimating the value of the oranges at \$1.90 a field box, we have a gross increase of \$615.00 due to the *Arcadian Sulphate of Ammonia* which cost only about \$28.00 per acre.

Control of Black Scale

By Ernest Branton

It seems reasonably certain that the happy day has arrived when natural parasites will control the black scale pest. The search for

such parasites, their collection, breeding, distribution and protection, has taken 30 years time and tens of thousands of dollars, but the outlook seems to fully justify that procedure. On

December 10 official representatives from many counties, departments and citrus growers organizations gathered at Santa Paula to canvass the field where the most active and extensive of this control work has taken place. There were present a committee of three from the directorate of the California Fruit Growers Exchange, representatives of the state department of agriculture, several represent-

ing United States departments, seven county horticultural commissioners, a goodly number of county inspectors and a few invited guests. A printed program for the day was distributed by Commissioner Call, in charge of the meet. The first three stopping places were insectaries, those of the state (a branch), the Santa Paula Citrus Association, and the Limoneira Company. At each of these insectaries was shown the methods of breeding and care of the various insects, such as aphycus, cryptolaemus, rhyzohius and scutellista. The newest phase of this work is in the economy of collecting colonies for distribution, in the past a slow job. Now each insectary has a small hatching room where all is dark except for a small opening at one end covered with cheesecloth. The temperature is kept at about 80 degrees, and as the insects hatch they congregate on the cloth window pane and are collected with not more than one-tenth of the time and labor necessary under the old time "hide and seek" game.

From the insectaries the gathering made a canvass of several blocks of lemons on the Limoneira ranch where the aphycus had been liberated at a varying number of months ago. This story is well told by Horticultural Commissioner Ryan elsewhere, so we will go back to the Glen Tavern for lunch. At 1:30 an inspection was made of the work of Rhizobius ventralis on the Thille estate and that of the Aphycus lounsburyi in the Bloeing orchard. In the latter place no insects had been liberated, but the wind had carried them across the road from one of the Limoneira groves, and so thoroughly had they cleaned the trees that the owner gave up an intended fumigation, for the orchard a few months ago was decidedly "dirty" with black scale. The day's inspection was ended by a visit to the Sharp orchard to note further work of rhizobius.

Society Note

On the evening of December 9 the visitors who had arrived at Glen Tavern, 16 in number, were captured after dinner by former Horticultural Commissioner Brock and taken to his commodious home for an evening of pleasure. H. M. Armitage entertained with selections on the banjo and ukulele, Inspector Pickering of Orange County played the piano and a few of the visitors tried to sing, but with deplorable results. Games of cards were played and a series of checker games for the "horticultural" championship of Southern California. In the finals Commissioner Ryan capitulated to Inspector Pickering. Selections on the Edison phonograph were given by Mr. Brock until midnight, when the visitors journeyed back to the hotel and slumberland.

INCENSE CEDAR NOT AN INFERIOR TREE

Though incense cedar is not a rare wood pencil manufacturers and cabinet makers have difficulty in keeping a sufficient quantity of this material in stock. It is estimated that there is a supply measuring 11 billion feet in this country, of which ten billion are located within the boundaries of California. The trouble is that the heartwood of incense cedar is commonly honeycombed by a dry rot which makes a large part of it valueless for timber. On account of this experienced lumbermen consider incense cedar an inferior tree and frequently reduce estimates by 30 to 50 per cent. It costs as much to cut and bring to market a diseased tree as a sound one, and lumbermen hesitate to work with a wood which gives such a large average loss.

ANOTHER BIG CHERRY TREE

Noticing in your issue of December 4 that R. Atherton and W. J. McGrath have large cherry trees and in true California style invite comparisons, will say that I have a cherry tree growing on Orangedale Farm that measures ten feet two inches in circumference and is 70 years old, bearing heavily. This tree is located eight miles north of Santa Rosa, Sonoma County, the place that is known on the map as the home of Luther Burbank. Now let another brother speak—Sheridan Peterson.

Horticulturists at Santa Paula

From left to right: H. M. Armitage, assistant entomologist, Whittier state insectary; J. D. Culbertson, assistant manager Limoneira Ranch; Harry S. Smith, entomologist in charge of pest control, Sacramento; A. J. Flebut, United States department of agriculture, Fresno; J. N. French, inspector, Oxnard; E. A. Bennett, director California Fruit Growers Exchange; A. A. Brock, entomologist of Santa Paula Citrus Association (in rear); Horticultural Commissioner H. J. Ryan, Los Angeles County; Paul Howard, in charge Upland branch insectary; R. L. Knox, director California Fruit Growers Exchange; A. I. Rittue, inspector, Oxnard; R. H. Wilkinson, director California Fruit Growers Exchange; R. S. Woglum, fumigation and pest expert, California Fruit Growers Exchange; G. R. Gorton (the tallest), horticultural commissioner San Diego County; S. G. Essig, entomologist Limoneira Ranch; Victor Casner, inspector, Fillmore; E. S. Kellogg, horticultural commissioner Santa Barbara County; A. H. Call, horticultural commissioner Ventura County; C. Oleson, inspector, Fresno; F. S. McCloskey, inspector, Santa Barbara; A. M. Pope, inspector, Santa Paula; J. P. McCoy, horticultural commissioner San Bernardino County; C. C. Staunton, farm adviser Ventura County.

TO USERS OF PIPE

We are overstocked on the following sizes of PACIFIC SCREW PIPE and CASING. All of this stock has new threads and couplings, is STEAM TESTED and guaranteed for 150 pounds pressure all ready for immediate delivery.

Irrigation in the Orange Orchard

By William M. Bristol

IN responding to the request of the editor for an article under the above heading I must preface my remarks with the observation that some thousands of years experience in tilling the soil has not taught the human race all that it needs to know in connection with the art. And 30 years experience in orange culture on the Highland foothills has not convinced me that irrigation of the orange has been reduced to an exact science.

Perhaps the best method of considering the needs and the possibilities of an orange orchard is to regard it as one would a factory or a dairy; for it is literally an establishment for transforming raw materials into a finished and salable product. And I am persuaded that many a would-be orange grower has failed to get the highest possible returns from his orchard because, instead of trying to see how much raw material he could thus transform, he has tried to see how little he could get along with. The furniture manufacturer endeavors to have his machines and his employees transform as much lumber as possible into furniture, and his financial success is closely linked up with the quantity of his production. The dairyman does practically the same thing. Letting his cows go hungry or thirsty would not lessen his overhead expense, but would lessen his profits. I believe that the same logic applies with equal force to the orange orchard.

It naturally follows that a man who believes thus also believes in the maxim, "Never let your trees tell you what they need." There have been and there will be periods of scant water supply; but I can think of no reason why an orange grower should treat his trees unnecessarily to an artificial drouth. The orange tree is not only an evergreen but an ever busy tree. If the crop is matured it still needs moisture to keep the fruit plump and in good condition, and we whose orchards are on the dry and warm foothills know by experience that the Navel orange clings to the tree more tenaciously if it never wants for water. I doubt if any plant or animal profits either by feast or by famine. We know that an orange cannot stand still with profit at any stage of its development, and we know that even after it is apparently fully grown and ripened it continues to increase in size and weight.

Having discouraged false economy in irrigation during the period most nearly approaching dormancy, it should hardly be necessary to urge the free use of water at all other seasons of the year. Certain it is that if the beneficent cover crop is to be used in the orange industry the freest possible use of water must be practiced. After several years of experimentation with summer cover crops I regard it as a misfortune that California has not an unlimited supply of water to be used in their production. I am using 20 inches continuous flow of water on 45 acres of oranges—and wishing for more. For the summer cover crop loosens the soil as no cultivator ever did and at the same time puts humus into it.

It may interest some to know my method in this connection. During the first week in June alternate lands are sowed to cow peas, the other lands being kept under cultivation until August, when they are also sowed to Blackeyes, which make a quicker growth than the Whippoorwills. One two-horse team does all the work on the 45 acres, and that without a sign of being overworked. I have never seriously contemplated the purchase of a tractor, preferring to keep the pump in continuous operation in the production of cover crops whose roots leaven the soil and admit light and air and water. Verily, most of Nature's methods are better than the boasted inventions of man.

The editor also asks if I have any hints which will prove economical or valuable to any grower as to pumping or conveying or using water in the orchard. Just one, to those irrigators who use plunger pumps. I must tell of a new valve seat which I put in my pump a year ago and which has

proved such a success that I deem it my duty to tell others about it.

Most plunger pumps use a cone shaped clapper or valve on top of each plunger. These clappers have two seats, an inner and an outer one. For some reason which has not been definitely determined, the inner seat wears faster than the outer one, with the result that a considerable percentage of the water which should be pumped to the point of discharge is lost by slippage. Within 30 days after installing a new pump with a capacity of 20 inches this inner seat had worn to such an extent that it was lifting only 17 inches. I had the plungers pulled out, the cone shaped clappers removed and replaced by new clappers so made that the inner seat was cut away and replaced by two cup leathers which work against the center stem and close the annular aperture which was supposed to be closed by the inner seat of the old style clapper. After being in continuous use for more than a year these new fangled seats are still water tight and have required no repairs whatever. These two little interior cup leathers perform the same service, relatively, that the cup leathers on the outside of the plungers do; that is, they close the space that would otherwise exist between the two metal surfaces. I estimate the saving in water, in pulling of the plungers and in lathe work on the valves to be equivalent, in my eight inch pump lifting 20 inches of water, to \$2 per day. And the value of the water saved and transformed into oranges must be several times as much.

It should be remembered that the orange tree is not a native of our arid region, and it would be folly to try to educate it to flourish here without the necessary conditions artificially created. There are only two conditions under which an abundance of water can result in injury to an orchard. First, on a fine grained soil irrigating on too steep a grade may sluice away the extremely valuable top soil. Second, on a very coarse and loose soil too much water will leach out the nitrogen into the under drainage. In the Highland and Redlands region many acres of the former soil has been protected by covering it with a coarse and loose soil, and many acres of the latter has been benefited by covering them with a layer of fine grained soil which stops the pores and prevents the leaching process from carrying away the fertility. This wholesale transfer of soil is an expensive practice; but many thousands of loads have been so transferred and always with marked results. In the case of either class of soil the practice helps to conserve the life giving fluid and is a valuable adjunct to irrigation as well as to fertilization.

There is a rather limited area in California where all conditions are favorable to orange culture, and this limited area is destined to become increasingly valuable as time goes on. It will pay to provide water for the warm and sheltered foothills at almost any cost, and the wise orange grower will use as much water as his trees can absorb—provided always that money can buy it.

TRACTOR COURSE

The second annual tractor and auto short course of the Fullerton Union High School will be held on the school grounds, January 17-22. Mornings and afternoons will be given to study of the construction, operation and repair of the leading local tractors, while the evenings will be devoted to a like study of the leading local automobiles and trucks. The course will be given by auto and tractor experts and will be free to as many adults as can be accommodated.

Directors of the California Associated Raisin Company and the California Peach and Fig Growers have announced a building program for the coming year involving the expenditure of \$1,100,000. The Peach and Fig Association will spend \$500,000 for a plant in Fresno and will erect another in Dinuba at a cost of \$75,000.

Krogh Pumps

THE KROGH DEEP WELL TURBINE

has been built for eight years. The first Turbine built by us is still in successful operation after running eight years. These pumps are so designed and constructed that the main parts do not wear. All bearings contain removable bushings which can be replaced when worn, but the expensive bearing container itself does not wear.

The shaft is made in ten foot units and when worn at the bearings, as it will in time, a short stub about one foot long can be inserted, raising the shaft up to a new bearing point. This can be repeated many times before the shaft is entirely worn and useless. Where the shaft passes through the pump casings the shells are protected with bushings to protect the shells.

The pump head of new and improved design we claim is superior in construction to anything on the market. This head is very heavy and rigid and has a heavy radial ball bearing on each side of driving pulley. These bearings are finely constructed, the heavy ball bearings being packed in grease and require new lubricating at long intervals only. The construction is such that the grease cannot leak out nor dust get into the bearing. The discharge from pump head is below the floor line which results in the pump house floor being unobstructed and can be evenly floored over. If motor connected, a flexible coupling is provided, carefully balanced, machined and polished all over. If belted, a balanced pump pulley heavily crowned.

Our pump column is in a class by itself. Column is made in ten foot lengths, all joints being flanged, the bearing spider being held between each flanged joint and is centered therewith, insuring that all bearings are in line, no matter how often the pump is taken down.

No pipe tongs are required to install our pumps as all joints are fitted with flanges before pump is shipped.

These pumps are built in sizes 9 inches in diameter, having a capacity up to five hundred gallons from a ten-inch well to pumps twenty-four inches in diameter and having a capacity of four thousand gallons per minute.

WRITE FOR BULLETIN 85C

We also build a complete line of Horizontal and Vertical Centrifugal pumps for either direct connection or belt drive. All our pumps are provided with our Patent Hydraulic Balance which prevents end thrust automatically and requires no setting or adjustment of any kind. This Automatic Balance is a feature found on no Pump except a KROGH.

Efficiency in Irrigation

By G. E. P. Smith

HERE is such a thing as efficiency of irrigation. It may be defined as the ratio of water beneficially used to the total water diverted onto the land. The water beneficially used is the water that is actually drawn upward by the plants (not including weeds). The losses of water are by evaporation from the soil direct, by seepage downward beyond the reach of plant roots and willful or careless waste, which includes irrigating the county highways. These losses aggregate from ten to 80 per cent of the water applied, depending on the method of irrigation and how well the irrigation is performed.

Another loss of irrigation water is that by seepage and evaporation from canals and ditches. This, the greatest loss of all, should not pass without comment. Nearly all of this loss is by seepage. Measurements of the seepage losses on scores of canals and ditches have been compiled and published. The results are startling. Losses of over ten per cent of the water per mile ditch are not infrequent, and it is concluded that "a large percentage of the water estimated at 40 per cent of the amount taken in at the heads of the main canals, is lost by absorption and percolation along the routes." The records of the U. S. reclamation service in the Salt River Valley state that the canal losses between the diversion dams and the points where water is delivered to the water users have been 40 to 45 per cent of the total amount diverted. While the losses as given in the records may be overstated somewhat, it is certain that at least one-third of the water diverted is lost in the canals. The losses from the Avondale canal are 40 per cent in the first four miles.

Cement Pipe for Irrigation Conduits

The great advantage of the use of

cement pipe for irrigation conduits lies in the fact that the seepage and evaporation losses from open ditches are prevented. These losses are appalling. Dr. Samuel Fortier, chief of irrigation investigations, U. S. department of agriculture, states that a large percentage of the water, estimated at 40 per cent of the amount taken in at the heads of the main canals, is lost by absorption and percolation along the routes. For small canals these losses are often over five per cent per mile in adobe soil and 15 to 20 per cent in porous soil. In Southern California there are extensive distribution systems that are piped throughout so that the loss of water in distribution is practically nothing. As a result of this and other economies the duty of the water is nearly nine acres per miner's inch of flow. The average duty of water can be increased greatly by the use of cement pipe for small ditches and concrete linings for larger ditches and canals.

No practical method of preventing canal losses has been found except by the use of concrete linings for large canals and cement pipe for small canals and for farm ditches. Linings and cement pipe lines have been highly developed as to permanency and efficiency, and the cost is so low as compared to the value of the water saved that it is only good business economy to make the investment. Linings and pipe lines have many additional advantages. They obviate the need of an expensive drainage system to prevent waterlogging.

The maintenances of open ditches is difficult. Weeds and algae grow rankly and occupy the whole cross-section of the ditch. Bermuda and Johnson grass thrive along the banks. Unless this vegetation is removed at frequent intervals it obstructs and diminishes the flow. Ditch cleaning is very expensive. A small ditch near Tucson, before it was lined,

cost \$80 per mile annually for cleaning alone. In the Yuma Valley the cost of cleaning lateral canals by hand is about \$550 per mile. Furthermore, gophers perforate open ditch banks and cause the waste of rivulets for days or even weeks before the holes are repaired. Sometimes the holes enlarge and the ditch bank breaks, with consequent loss of the entire stream. A break on the Turlock canal of California in 1910, thought to have been due to a gopher hole, caused

ing. Less labor is required, also, to irrigate from pipe lines than from open ditches.

Again, there is a great saving of land. Open ditches occupy about one per cent of the land, but the necessity for turning teams on each side makes the loss three or four per cent. An open ditch is a great obstruction and interferes with farm operations. With cement pipe the loss of land is practically nothing.

The writer has often said that the

Economy in Time and Water Secured by Modern Equipment
Metal gates on concrete pipe in irrigation mean greatly increased duty for water and efficiency of service.

1,000 feet of the canal on a steep hillside to be washed out, and the canal was out of service for six weeks of the period of maximum need for water; the actual cost of repairs was \$20,000, but the damage to crops was estimated at \$1,000,000. The maintenance of cement pipe lines is so small as to be negligible.

Another reason for using cement pipe is that distribution lines can be run through low places and over ridges; it is not necessary to follow grade lines, for the water can be carried under pressure through the low portions of the line. This makes it possible to square up the fields much better and to reduce the cost of grad-

only valid excuse for not adopting concrete lining or cement pipe is that the irrigation company or association or the rancher does not have the money and does not know where to get it.

In many irrigated districts water supplies seem to be quite fully utilized, but when the losses of water are analyzed, we find inviting possibilities of extensive increases in present acreage by changing methods and practices to eliminate waste.

Well Intentioned. "What is the use of this article?" asked a shopper.

"I really don't know," replied the clerk; "I think it is intended to be sold for a Christmas present."—Harper's Magazine.

Teague Quality Trees

Citrus and Tropical

Grown from record buds on selected root stocks and properly cared for from seed to tree, ready for the planter. A combination that insures a strong vigorous tree which will produce maximum results both in quantity and quality of production.

Whether planting for home or commercial purposes, you cannot afford to use anything but the best. *TEAGUE QUALITY TREES* fill every requirement.

CITRUS

AVOCADOS

FEIJOAS

All the commercial varieties of oranges, lemons, pomelos and limes, also a fine assortment of new and rare varieties.

Those varieties recommended by the California Avocado Association, all budded on hardy Mexican seedlings.

Grafted from the best large fruiting varieties.

*The Supply of First Class Citrus and Tropical Fruit Trees for 1921
Planting is Limited and Those Wanting the Best
Should Place Their Order Early*

Our new descriptive price list covering all varieties grown by us will be mailed free to those interested.

Planting an Orchard

By J. B. Neff

THE success of an orchard depends on many things, among which the selection and planting of the trees and the early irrigation of the orchard are very essential. A soil with good drainage is needed and if it is one that is easily cultivated and retains moisture to a good degree, so much the better. Hardpan at any depth is to be avoided, as well as shallow soils underlaid with coarse sand. Some varieties, such as pears, will tolerate some alkali, but the less alkali the better, and most fruit trees will not succeed in alkali soil. The land should be graded to an even slope to aid in the equal distribution of the irrigation water and to prevent uncovering the roots of the trees in one part of the orchard and depositing too great a depth of soil over the roots in other parts. Fertile soil is greatly to be desired, as the process of building up fertility in depleted soils is both slow and expensive.

Trees should be bought early and only the most vigorous trees of any variety should be planted. The orchard rows should be arranged with reference to the plan of irrigation rather than according to the points of the compass. Do not plant too many trees on an acre unless they are planted with the purpose of taking out alternate rows after they have become too close for profit. This taking out, though, is seldom done and the orchard would, in many cases, be better if fewer trees had been planted at first.

Stocky trees are better than slender trees, and if peach and apricot are four to six feet in height with good root systems they will make better orchard trees in less time than if the taller and more slender trees were planted. The roots of these should be clean and free from diseases. The bruised roots should be trimmed with a sharp knife, leaving only sound roots, and the planting should be done as soon after taking the trees from the nursery row as is possible. Do not put fertilizers of any kind in the holes when planting trees. Stable manures are likely to heat and ferment, thereby damaging the trees, and commercial fertilizers are too concentrated to come in contact with the roots without damage to the trees.

Planting

Dig large holes and plant the tree so that when the soil has settled the tree will stand at the same depth as when growing in the nursery. Use only the surface soil to fill around the trees, and where the trees have naked roots, arrange the roots by hand, working the soil among the roots and so there will be no roots crossing and touching. Firm the ground slightly but do not make it compact at any time. Deciduous trees should be planted in January and February, if possible, as they are dormant at that time and will be better established in their new location when the growing season begins. Oranges, lemons and other citrus trees will be better if planted later in the year, when the growing season is beginning. It is best not to risk planting citrus trees without taking up with balls, though we have been shown orchards taken up with naked roots that did well. This, however, was done in damp weather and early in March.

After the deciduous trees are planted they should be cut back to a single stem 18 to 24 inches high. Citrus trees should be cut back so as to leave not more than six inches in length of branches above the original heading which was done in the nursery. These branches should be thinned so as form the desired head for the tree and at least half of the remaining leaves taken off so as to prevent too heavy drain on the very much depleted root system.

Irrigating

We will assume that an ample and perpetual supply of good water has been secured before the planting has been done. This must be free from alkali and other injurious salts, as the continual addition of small quantities of these salts will finally accumulate an amount that will render the land

useless for orchard purposes. It is good practice to run water around the young trees as soon as planted. This settles the soil and closes any air spaces that may have been left in filling the holes, and brings the soil in close contact with the roots, prevents injury from drying winds and leaves the young tree ready to begin its growth when the warmer days come. A small stream of water in a single plow furrow will be all that is needed at this time.

The irrigation of newly planted trees should be very frequent during the first summer. The roots have been almost altogether removed and the remaining parts are short with but few fibers, consequently can reach but a small area of soil. Trees as well as other plants can use their food only in a liquid form, and if the soil is dry around the points of their roots growth will stop until more moisture is sup-

plied, either by irrigation or by the movement of soil water from some distance, and this movement is often so slow that the trees are checked and so lose some weeks in recovery when a new supply of water is put around them. It is safe to irrigate young trees every ten days during the first four months after planting and every two weeks during the balance of the growing season. It is sometimes said that fewer irrigations will compel the roots to go deeper after moisture, but this is a mistake. If the soil is cultivated to a proper depth any roots that might be inclined to come too near the surface will be cut off, and if there is water at the lower level the roots will reach for it in that direction. These first summer irrigations need not take a strip of more than six feet wide for the first three months, but after that should include a space of at least 12 feet in diameter at the tree. Smaller amounts of water can be used than is required for larger trees, but the cultivation should be thorough after each irrigation.

AVOCADO DISEASES

In a report of the Florida State Horticultural Society, H. E. Stevens says that among the troublesome fungus diseases of avocado in different countries, rusty blight, root rot, and anthracnose are regarded as the most serious. The first two named are not known to occur in Florida, but injury has been caused by anthracnose or closely related diseases. Leaves and fruit are attacked by a fungus supposed to be a *Gloeosporium*. A *Colletotrichum* is often found on diseased leaves and fruit spots. This is controlled by timely use of Bordeaux mixture.

Of two apparently new and undescribed diseases, one is a fruit spot. The other, primarily a disease of young tender foliage and named avocado scab, has been proved by a series of experiments to be caused by the same fungus as that producing citrus scab.

Look to the Future

The Trees You Plant Today Will Be In Bearing

COME OUT OF YOURSELF

Don't live like a hermit inside of yourself—
Forgetting, forgotten of men:
There's something in life besides piling the self—
Come out in the sunlight again!
Though money is something to help you along,
It isn't as good as a smile;
There's health in a laugh, there is wealth in a song—
Come out of yourself for awhile!

The fellow who lives in his own little soul
And never comes out of his shell
May gather a million, may garner a roll,
But what is the good in a cell?
Why lock yourself up in a prison of pride
And, when you have come to the end,
Have no one to care that you live or you died,
Because you had never a friend?

Come out of yourself and step into the sun,
Come out of the gloom of the cloud;
Come out of yourself and get into the fun
And walk in the midst of the crowd.
For troubles, like mushrooms, will grow in the dark,
But they can't stand the glow of the day—
The perfume of roses, the song of the lark,
Are waiting just over the way.

The world may go wrong and be freighted with care,
Misfortune may handle you ill,
But still there are plenty your troubles to share
And give you a lift on the hill.
If you have forgotten fraternal delights,
Your lips have forgotten to smile,
Here's something to cheer you, to set you to rights—
Come out of yourself for awhile!
—Douglas Mallock in the Classmate.

GETTING MOTHER'S PRESENT
(Concluded.)

"Joe Brown's wife is going to get a nice present; he's giving her ten one dollar bills."
Mr. Bengé put this out as a feeler.
Mrs. Bengé sniffed:
"Kate won't thank him for that."

"How did she know he chose it himself? What was it?"
"Link chose it, all right; no one but him would have bought anything so out of keeping. It is a red velvet toilet case, with cut glass bottles. It must have cost a good deal, but the perfumery Link had bought to fill the bottles"—Mrs. Bengé laughed, almost hysterically—"came, I should say, from the ten cent store."

"You call that a beautiful present which you say is out of keeping? I know you can't bear cheap perfumery."
It was a beautiful present, and I abominate cheap perfumery, but if you had bought me that present, thinking to give me pleasure, of course I would love it."
"You mean to say you'd like anything I chose for you, whether you had any earthly use for it or not?"
"Of course," Mrs. Bengé hedged, "I'd rather have a gift that I like, and one that I wouldn't feel like buying for myself; but I'd rather have a gift you chose, even if it wasn't as suitable as one you were told to buy."
"I'll go to town tomorrow and buy the first fool thing I see," Mr. Bengé thought to himself. Aloud, he said, sharply: "That's just like a woman, tickled to death with a glimmer she has no earthly use for, and turns up her nose at a present a man buys if she thinks he had a hint that she would like it."

It was almost bank closing time when Mr. Bengé reached town next day, and he hurried in to deposit his corn money. While making out his deposit slip, he noticed the banker's daughter come in to speak to her father. Mr. Bengé caught the first sentence, and stopped to listen. The girl was apparently talking about Christmas gifts.
"Oh, father," she said, "there is the

In the Garden of Years

He had pulled an easy chair up to the fire and now sat nodding drowsily in the warmth. For the last dozen years he had watched for the birth of each new year in this fashion, and now he sat, waiting patiently for the striking of the clock in the distant steeple. The last piece of coal in the grate fell apart with a tiny spurt of flame. The nodding head bowed lower.

The bell began striking the hour—
With the first intonation, the man was suddenly alert. The fire in the grate, the mantel and the wall of the room had vanished. He seemed to be standing upon a slight rise in a prairie, gazing with interest over the sloping ground before him. Below him an old man, clothed in a single enfolding garment that was girdled at the waist, swung a scythe through a rank growth with an ease and strength that set his years at naught. It was a peculiar growth that he was harvesting, but the man on the hilltop, with the acute understanding that had suddenly come to him, knew that this was Father Time reaping the harvest of deeds in his garden of years. As he watched the rhythm of the strokes, a voice, as clear and mellow as the tones of a bell, came to him.

"We reap what we have sown. Good seeds sown in proper soil give forth a bountiful harvest; poor seeds sown in any soil yield only barren stalks. Come, you shall see the harvest of your deeds."

The man felt a touch at his elbow and he was gently pushed down to where Father Time had just finished a section of his work.
"Here is the reaping of the seeds you have sown in the past year," came again the bell-like tones. "You see the yield is not large. Over there are a few stalks with well-matured heads. They represent your action when you gave three days of your own valuable time to harvest your neighbor's grain when he was badly wounded by the knives of his binder. The richness and quality of the grains will make up for many of these barren stalks. Here is one only partially filled out. It is for the time when your 'year-man' lost his baby and you regretted more the time he was forced to leave his work than you did the great sorrow that had come to him. A kind word then would have brought this grain to full maturity. All these poor, undeveloped wisps of grass you see in this window are the good deeds you could have done, but did not; a kind word you did not speak; a frown you preferred to a smile; a favor you could have granted but would not. The pile is large, but it could be larger."

"Over there you see a new bed, with the fresh, green plants just peeping through the earth. That is the bed of your deeds for the coming year. You can do much with them, if you will. You can plant more and better seeds so that your harvest at the end of the year will be full and rich. A little tolerance for the weakness of others, a smile for those that honor you, a kind word to the ones in error, sympathy for the great number in trouble and sorrow, a strong hand to the weak and stumbling; all these and many more are the things which, if planted with the deeds of every day, will weed out the puny stalks of your present harvest and bring from the richness of your life a reaping which will sweeten and gladden the advancing years."

Slowly the scene receded into the distance. A mist arose from the earth and closed the fields from view. The bell-like voice that had started strong and full, now grew fainter and fainter as though borne away upon invisible wings. The coals in the grate began again to glow in the darkness as the room took shape. The man slowly stretched out his arms—
And the bell finished striking the hour.—Lorenzo D. Van Doran.

She will likely spend it all for the house and the children. Money is a fine gift from anyone but your own husband. Joe wouldn't think a receipted grocer's or store bill was a Christmas present for Kate, but that's what money from him to her amounts to. She won't have anything for herself to show for it, as Mrs. Marsh has. You know I called on Mrs. Marsh today, John. It's three years since her husband died, and she brought out his last Christmas gift to show me. It was a beautiful present. She cried like a baby over it, because it was the last thing Link chose for her himself."

dearest silk petticoat in Baum & Daniels. You know they are having a sale—and the petticoats they are offering at from one to ten dollars are worth twice that. If mother saw that gray in the south window, she'd love it; it's a perfect beauty—a ten-dollar one."
Mr. Bengé saw the two exchange glances. "See here, girl," the father said, in mock sternness, "I claim the privilege of choosing your mother's Christmas gift myself."
"Well, anyway, her skirt measure is forty inches," replied the girl.
Mr. Bengé considered. A petticoat would make Mrs. Bengé a fine present.

The Cultivator
Patterns

BE SURE TO SEND SIZE

3441. A Set of "Short Clothes."—Cut in five sizes: 6 months, 1, 2, 3, and 4 years. A 2 year size will require 3 3/4 yards of 27 inch material for the dress, 1 1/2 yard for the slip, and 1 yard for the drawers. Price 10 cents.
3442. A Youthful Gown.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A medium size will require 4 3/4 yards of 41 inch material. The width of the skirt at lower edge with plaits extended is about 2 yards. Price 10 cents.
3434. Girls Dress.—Cut in four sizes: 6, 8, 10 and 12 years. A 10 year size will require 3 3/4 yards of 36 inch material. Price 10 cents.
3439. Ladies Apron Dress and Cap.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 7 yards of 27 inch material. The cap will require 1/2 yard. Price 10 cents.
3438. Two Dainty Aprons.—Cut in one size: Medium, No. 1 will require 3/4 yard of 36 inch material; and No. 2 will require 1 1/4 yard. Price 10 cents.
3459-3445. An Attractive Costume.—Waist 3459 cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3445 cut in seven sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. To make the costume for a medium size will require three yards of plain material and four yards of plaid or checked, 34 inches wide. The width of the skirt at the foot is 1 1/2 yard. TWO separate patterns, 10 cents FOLD EACH pattern.
3455. Girls Coat.—Cut in five sizes: 6, 8, 10, 12 and 14 years. A 10 year size will require 3 3/4 yards of 41 inch material. Price 10 cents.
3443. Misses Dress.—Cut in three sizes: 16, 18 and 20 years. An 18 year size will require 4 3/4 yards of 41 inch material. The width of the skirt at the lower edge with plaits extended is about 1 1/2 yard. Price 10 cents.

Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT
California Cultivator,
Los Angeles

He felt grateful to that girl. When he carried his checks and deposit slip to the window, he said: "I have a girl about the age of yours; she's away at school, coming home for Christmas, though."

"They come in handy the year 'round—especially when presents are in order. I'm afraid most special occasions would slip by without my remembering them if it wasn't for my girl," replied the banker.

"I'd rather do a day's work than to tackle an hour's shopping, but my wife wouldn't be satisfied unless I bought her present myself," ventured Mr. Bengé.

"Mine wouldn't either," confided the banker. "If it wasn't for Sue, my daughter, I'd be lost."

Mr. Bengé made his way around to Baum & Dandels. Women were crowding into the store. One lone man made little headway in the good natured throng. "It's worse than a stampede of cattle," he sighed.

"Anything I can do for you, sir?" an attentive floor walker inquired.

"I want a petticoat for my wife."

"Did you want an ever-wear, near-silk, or all-silk. We have some splendid bargains in taffetas."

"I don't know a blamed thing about them. I want something frivolous enough for a Christmas present—something that a woman won't use every day."

"Show the gentleman some near-silk petticoats in gray, Miss Fay—something about five dollars, sir?"

Mr. Bengé nodded.

"I'll be disengaged in a few minutes," said the girl. The floor walker went off to other customers, and Mr. Bengé waited. Customers came and went, apparently the girl had forgotten him; he wasn't sure that he remembered her, and no other clerk came to him; the throng of eager women picked them up before he had a chance to claim one. He heard a lady say to a clerk: "I'll take this gray and blue. Send them to the transfer desk, please, and mark collect. I have other shopping to do, and will pay at the desk."

If he could get that floor walker again he, too, would have the skirt sent to the transfer desk, or if he could catch the eye of a clerk for a minute. At the insistent ringing of the telephone bell, he saw the clerk at the transfer desk leave her work to take down the receiver. Why hadn't he thought of that? Of course the telephone was always answered.

Making his way out of the crowd, he went into a telephone booth in the drug store across the way and called up Baum & Dandels.

"This is Mr. Bengé talking," he said. "Can you wrap me up a five-dollar near-silk, iron gray petticoat, skirt length forty, and have it at the transfer desk in fifteen minutes? All right, I'll call in fifteen minutes, then, and pay at the desk."

Fifteen minutes later a happy man was carefully storing away a box bearing the label of Baum & Dandels, under the buggy seat. Mr. Bengé had finished his Christmas shopping; he had chosen a Christmas gift for his wife.

"Christmas morning Mrs. Bengé shook out the folds of the lovely new petticoat hanging over the chair by her bed. "It's what I've always wanted, and never believed I would have. It's almost too good to be true," she exclaimed.

"I kind of thought you'd like it," Mr. Bengé stretched his feet out luxuriously towards the fire, the better to see his new slippers. "I'd rather have these slippers, myself."

"Did you suggest that he get me this skirt?" Mrs. Bengé stopped in the work of getting dinner to ask Sallie.

"Indeed I did not. I didn't suggest anything to him. Father always gets his Christmas present himself," Sallie replied with spirit.—Wallace's Farmer, Des Moines, Iowa.

We'll labor and battle and push our way upward
In days that the incoming New Year will bring.
From the grave of the old to the brave and the bold
Success and achievement will certainly spring.

HINTS FROM HOUSEKEEPERS

Cold Compress on Throat

I very much enjoy reading the household page of the Cultivator and want to tell the readers, especially the mothers of children, a sure and almost instant relief for cough at night. Just a plain cold wet compress on the throat. About four thicknesses of cloth just large enough to cover the throat for the wet with plenty of dry over it, secured by a rather thin bandage about the neck. A meal sack folded to four thicknesses makes a fine bandage. Some think flannel necessary when compressing, but heavy bandages make the back of the neck too warm.

I was brought up on compresses of various kinds, my father being a physician of the hygienic-therapeutic school, but we did not know of their wonderful value for coughs until quite recently my little six year old boy began coughing after getting in bed. Thinking each time it would be the last, I didn't go to him for an hour, as I was in bed too, but as he didn't seem to be getting over it I got up and put the compress on his throat and he stopped almost instantly, gave one cough, a second time not much more than a suggestion of a cough, and that was the last all night. It has helped when nothing else would, so I want other mothers to know of it.—Mrs. A. G. Shell, Rumsey.

Candying Apples

Do you think the enclosed is what "Subscriber, Salinas," has in mind for candying apples for her children's party? At any rate, it may be of use to her and I am also telling her of a pretty way to serve ice cream for the children which may appeal to her. I surely thought it both novel and beautiful.

Here's hoping this is what she wanted, and with best wishes for a "Happy Christmas and bright New Year."—Mrs. A. Stainton, San Francisco.

Dipped fruits covered with a frosting of fondant are very delicious. Here is a recipe that if followed exactly is sure to be successful: To 2 cups granulated sugar add 1 cup hot water and 1 large tablespoon glucose, mix well, cover saucepan and allow to boil without stirring till it forms a soft ball when dipped in cold water. Take from the fire and pour into an earthenware bowl and stir constantly one way till smooth and creamy. If it is found to be brittle, return it to the fire with a little hot water and boil up again. For dipped fruits, however, the fondant should be in a soft, creamy stage and it is well to keep it slightly warm by placing the bowl in hot water. The fruit, which should be firm and carefully dried with a cloth, is dipped piece by piece into the mixture and then laid on oiled paper to harden. If the coating is not thick enough, dip again. Canned as well as fresh fruits may be prepared in the same way. Delicious candies are made by dipping glace cherries in fondant and then rolling them in chopped nuts.—Mrs. A. Stainton, San Francisco.

"Illuminated Ice Cream"

Here is a pretty way to serve ice cream at a children's party that I saw on an ocean liner. The cream was served in blocks, a small piece was cut out of the middle of each and replaced with a tiny bowl made from a piece of cardboard turned up at the corners and having a lighted candle standing in it. This was managed by dropping a bit of melted wax in the bottom of the bowl to hold the candle upright. The candles were lighted at the last minute and the cream served immediately with the lights in the chandelier turned out. This "illuminated ice cream" produced a fairyland effect and children who have never seen it are sure to be enthusiastic about it.—Mrs. A. Stainton, San Francisco.

Oil Pickles

Here is one worth saving till pickling season comes round again. They are delicious: Two dozen medium sized cucumbers sliced, 1 pint vinegar, ½ cup olive oil (or salad oil), ¼ cup salt, ¼ cup sugar, 2 ounces mustard seed, 1 tablespoon celery seed. Mix and let stand 2 hours, then can cold.—Amanda C. Snyder, Glendale.

8,000 Miles GUARANTEED Without Punctures or Blowouts

They can't puncture—They can't blow out.

No pumping or patching or roadside repairs.

Ford, Maxwell and Chevrolet owners are getting 10,000, 15,000 and 20,000 miles of wear, in all kinds of service—on passenger cars and trucks—under all kinds of driving conditions.

Nothing can happen to Dayton Airless Tires but w-e-a-r.

Nothing stops them until they are worn clear down to the last pier of rubber. Remember—without punctures or blow-outs.

Do you use 30 x 3, 30 x 3½, 31 x 4 tires? If you do, spend your money wisely—buy Dayton Airless. It's true economy.

The next time you drive around our way, STOP—AND LOOK THEM OVER.

IRRIGATING THE VEGETABLE GARDEN

By A. R. Gould

It is because we have so often seen crop failures due to lack of moisture that we feel compelled to impress upon our readers the need for real efficiency in irrigation. Water is of first importance to plant life, and we must not forget that water plays a remarkable part in relation to crops. Water passing through the plant carries with it elements which contribute to its growth, and water passing through the soil, eventually evaporating from the surface, brings with it plant food held in solution, and this is taken up by the roots. It must also be remembered that some soils have a greater water holding power than others; heavy clay soils will have a greater water capacity than light sandy soils; and these facts must be taken into consideration when this great question of irrigation arises. Without the aid of water plants would starve, as it holds carbonic, humic and other acids in solution, these bringing into solution the ash ingredients of plant food. Water, therefore, is the medium of transport for these very necessary elements. With soil conservation we shall deal in later monthly notes, but there is always a considerable loss of water by evaporation, especially in the warmer sections of our state. Hence this is a very important factor and must not be lost sight of. As our rainfall varies considerably between the extreme northern counties and the more central, being from 69 to about 11 inches, and not nearly sufficient in the latter, it is necessary to resort to irrigation, and a system should be adopted which is thorough. There are many ways of irrigating. The most commonly used is the furrow method, and this furrow, made two inches wide and three inches deep, may be plowed out with the wheel cultivator plow or drawn out with the hoe through the rows of the crop. These furrows are then well flooded from time to time and supply the moisture directly to the plant. If a galvanized or wooden trough is made with holes at the sides, one to two feet apart, being controlled by slides, the water may be supplied through this to the furrows all at the same time if desired. Some large truck gardeners make beds two feet wide, bank the soil up around the edges six inches high and sow their crops, such as beets, carrots or lettuce, broadcast in this area, flooding it before sowing, which supplies enough moisture for germination, then flooding again after the seedlings are well through the ground. If the sprinkling system is adopted care should be taken to leave the sprinkler on the plots long enough to allow the soil to become well saturated, and this is not accomplished in five or even ten minutes. If you wish to find the distance or depth of moisture, try it with a spade. The moisture should be several inches deep. We always feel sorry for those who fool themselves with the gentle hand sprinkling movement lasting usually long enough to lay the dust. This is not effective, but a large number there are who practice it, and then wonder why they have no luck or poor crops. We never wonder; we know. There are a number of very satisfactory sprinklers and time saving automatic sprinkling systems on the market.

We trust that your New Year's resolve will be to follow this, the first and most important principle of irrigation. We not only desire to convey to our readers best wishes for the New Year, but much success, and we hope that we shall be of service month by month.

DO YOU KEEP RATS?

Rats invade the home, contaminating pantry and storeroom, destroy floors and doors, eat and spoil food and spread the most horrible of diseases. It costs Great Britain \$200,000,000 a year to feed its rat population. It does not cost the United States any less. Great Britain now has inaugurated an extensive campaign, and at stated intervals "rat weeks" are set aside all over the kingdom for the destruction of rats and the abolition of their nests and breeding places.—B. IRRIGATING THE YOUNG ORCHARD

By E. L. Koethen

We are told that the early settlers at Riverside were in some cases so impatient to begin planting their orange trees that they planted before the water was ready to spread on the land, so that they had to carry water from a neighboring brook in carts and water the newly set trees by bucketfuls for the whole first season. This was a laborious and expensive process, but it succeeded, and the trees which were seedlings grew, and are now large, thrifty trees.

We cite this now, not because we would recommend such a primitive method of procedure, but in order to show that in spite of crude methods success may be obtained. It has since been shown that in order to obtain large, thrifty trees quickly it is best to irrigate the entire surface of the newly planted orchard from the start, though some planters only irrigate one furrow at first, and when we first came to California we were told that the rule was one furrow the first year, two the second on each side of the trees, and three on each side the third year. The reason this method is not the best is that it encourages the roots to forage out farther from the base of the tree to have the whole space between rows moistened, thus a more extensive root system is encouraged from the start.

In order to make this practice finance itself, it is good practice to intercrop the orchard. Preferably this intercrop should be legumes. At the experiment station they have brought the experimental trees up to bearing age in this way. The crops of beans raised between the rows have paid for the cost of caring for the newly planted orchard. Thus not only have they obtained larger trees in a given time, but the soil has been enriched by the process.

The modern planter plows a deep double furrow where the row of trees is to be located. That is, he throws the soil both ways in the furrow. This reduces the labor in digging tree holes. When the planting begins he has a stream of water ready and carries it from hole to hole as fast as possible after the planters. Thus, as soon as possible after the tree is planted the hole is wet up, and the stream of water is carried around the tree on one side, in order that it may be carried on to the next tree. This insures quick root action and a rapid growth of the trees.

The time intervening between the planting and the next irrigation should be governed largely by local conditions, such as weather, nature of the soil and the rapidity of evaporation. But on general principles the next irrigation should follow in about two weeks. If the planting has been in the spring, the two weeks irrigation should be kept up during all the hot months. After that the time may be lengthened according to the judgment of the grower. On general principles irrigation should never be applied until the soil has sufficiently dried to be friable. It is just as important that the soil should be aerated as that it shall be kept uniformly moist. Soil that never becomes friable cannot allow the air to penetrate its texture and becomes waterlogged, which can only be a growing condition for water plants. It is, perhaps, a nice point, calling for experience as well as judgment, to determine just when the plant will receive the maximum benefit from irrigation. But it is perhaps better to err on the side of keeping the soil too wet during the first few months than to allow it to become too dry.

EFFICIENCY EQUIPMENT

With scientific methods of farming and fruit raising being employed in ever greater degree and more intensive cultivation of irrigated land becoming an economic necessity, it is natural that there should be a growing demand for better methods and conservation in the handling of water for irrigation and more accurate means employed for its equitable distribution and measurement.

There are such an infinite number of special conditions existing at one point or another in every water system that it is usually impracticable to adopt any one method to fit every

case, let alone find one that would be universal. But there are certain broad rules and codes of practice that do properly apply to every business undertaking, and there is no more excuse for ignoring or neglecting them in the case of water production than in any other line of business. These are to establish definitely, first, the quantity and cost of production, next, the normal distributing loss, or handling cost, and, finally, amount of actual deliveries in terms beyond dispute. These three steps may be expanded infinitely or done in simplest fashion, but so long as they are actually done a beginning is made that will soon be brought up to the same standards that are applied to the handling of merchandise or finance itself.

APPRECIATION OF COVER

Several have expressed heartiest appreciation of the beauty of the Cultivator cover of the issue of November 13. It was simply the photograph of a magnificent collie. A San Francisco subscriber writes this letter:

"Who is the lovely Shep dog on cover of California Cultivator, issue of November 13?"

"To what human is given the joy of his offering of unlimited love, as master?"

"Address."

"Is there any chance of buying a lineal descendant?"

"Price and to whom apply."

"Dogs like that one just win your heart looking at 'em and you want

to know all there is to know about 'em."

Unfortunately we are unable to give the information desired, for this dog happens to be a resident of Sacramento. He was photographed by McCurry, the Sacramento photographer who supplied the Cultivator with the photograph from which this engraving was made, so we take the opportunity of giving Mr. McCurry credit for his artistic work, which credit was not given at the time the photograph was used.

A few choice boar pigs for sale sired by the above boars. A few choice bred sows for sale at reasonable prices.

Castleview Ranch

Santa Rosa, Cal.

USE A SHORTHORN BULL

You need the extra pounds and the quality which Shorthorn blood produces. It seems to make no difference how big the Shorthorn steer gets, he retains the quality that enables him to top the market. A matter of 200 or 300 pounds at maturity makes the difference, often between profit and loss on your steer.

It pays to grow Shorthorn beef.

Ask for literature.

AMERICAN SHORTHORN BREEDERS' ASSOCIATION,
13 Dexter Park Ave. Chicago, Ill.

The Poor Farmer's Friend

RECENT scientific investigation has clearly demonstrated that milk and the food elements which it contains are absolutely essential to the best development of the child. Milk is nature's way of giving young animals a good start in life, and while man has made some wonderful discoveries, he has never been able to find an efficient substitute for milk as a food for young animals. Notwithstanding an extensive campaign of advertising to the contrary, we have

rural districts which has played no mean or lowly part in the development of the country folk.

On almost any farm there are more or less by-products which are allowed to go to waste every year. These by-products may be found in the form of fine, juicy grass along the roadside, or along our fences or streams. Again, may be in the form of countless tons of corn stover, or of vast amounts of straw and various grasses and in some cases even weeds which we allow to go to waste every year. Now, some one will say, "Is that what you feed your cows?" While I do not wish to go on record as recommending the above as an exclusive diet for our cows, yet I do think that we are letting enough of these materials go to absolute waste, if they were cared for and then mixed properly with a few well chosen concentrates and fed to any kind of a dairy cow, and the resultant products in the form of milk, butter, cream, cheese and last of all the cow herself, used for human food, it would materially affect the H. C. L. But some one says: "If so great possibilities lie concealed in old Bossie's hide, why, in the name of our common welfare, are you not producing more of these dairy products?" And right here lies one of the greatest problems confronting us as a people so long as the great mass of our people are insisting that they have all the necessities of life, and in too many cases the luxuries, with the least possible thought or effort on their part, we cannot hope for living conditions to be improved.

I once knew a college man who met a certain fair co-ed which ultimately resulted in a prominent young couple becoming tenants on father-in-law's well stocked farm, said father-in-law being a professional man in a near by city, but having originally come from the farm. One evening shortly after they had taken possession he said to his wife, "Let's drive out to the farm tomorrow and see how the children are getting along." So after the usual city breakfast they went to the farm. Mother went into the house to see her daughter; Father went out to look over the crops and the stock. Soon he found his new tenant. Various farm problems were gone over and finally they came to the cows. "Well," said the new father, "how are the cows doing?" To which the new son replied that he guessed they were all right; he had not noticed anything wrong with them. He was then asked how much milk he was getting. "Oh," he said, "the first day we were out here I got a bucketful from two of them and we have not needed any more since." As soon as father could get his breath he again ventured to ask his young hopeful if he did not milk those cows each morning and evening and was met with the answer, "Why, no, we did not need any more, so I just let them alone."

Now, here was a married man becoming a tenant and acting manager on a well improved modern farm, and yet he actually did not know that cows ought to be milked twice a day. You say that is a pipe dream, but it was told in that vicinity as an actual truth. But, true or false, it represents all too many people's idea of the dairy business. Dairying means work and a lot of it; it means work and seven days of it, each week through summer and winter. But to the man who is willing this is a real advantage. On the average grain farm there is a large part of the winter months that there is much idle time on the farm. A herd of cows will furnish employment the year around, and, after all, dairying is not so irksome as we might at first suppose. It has been proven time and again that this is one of the best methods of improving soil fertility, and there is abundant proof that old, worn out farms may be actually built up by a carefully managed dairy herd.

But there is yet another advantage and a very important one, and that is the matter of dollars and cents. A good herd of cows will provide a constant and regular income, nearer absolutely dependable than any other line of income for the great mass of our farmers. There is yet one other advantage, and that is the necessary capital which is required as an initial investment. It does not require very

University Livestock at Portland

U. C. Jock 4th, pure bred Angus steer, grand champion at Portland. He was reserve champion calf at Chicago.

Mary Ann Rush, first prize Shorthorn junior heifer calf and the sensation of the Portland show. This little lady was presented to the university by Senator Benj. F. Rush, Sulsum.

California Majestic, champion Shorthorn steer, and reserve grand champion at Portland. First as calf at Chicago last year.

Yearling wethers, first, second and third in class, first as a pen and the South-down in the center was champion.

Second prize pen of barrows under six months. They are pure bred Durocs.

always known that milk was good for pigs and calves and even chickens, but now come our eminent scientists to tell us that our rising generation must have milk or the future is seriously impaired.

We are told that recent statistics have revealed some startling facts in reference to the comparative physical condition of the city young men as contrasted to those from the rural districts, but I am of the opinion that if our country children were to receive the same care as to their physical bodies and as good medical attention, the statistics would tell quite a different story.

Any mother who has had plenty of milk and its products in the home and has then been deprived of the same, knows some of its undeniable benefits. You do not have to put on an advertising campaign to convince her that milk is an absolute necessity, especially for young children.

It is this almost unconscious and universal use of the dairy cow in the

Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Cottony Cushion Scale

How can I control cottony cushion scale? Just a couple of spots in the orchard. Is there any spray to use, and if so, when?—Subscriber, Sanger.

One need never be concerned over control of cottony cushion scale. The victory over that pest of citrus and many other orchard trees has become a classic in the history of fruit growing in California. We believe the state insectary at Sacramento is supplied with a sufficient quantity of vedalia cardinalis to colonize any orchard in the state. Write **Harry S. Smith**, State Insectary, Sacramento.

Best Time to Spray

What is the best time to spray lemon and prune trees?—Subscriber, Los Gatos.

It is impossible to answer so general a question within the limits of these columns. The subscriber gives no intimation as to trouble he wishes to spray for and we cannot cover the entire range of spraying. If one wishes to spray to control the attack of a fungous pest, the procedure is entirely different than when spraying for scale, thrips, red spider, or other insect pest.

Wireworms

Some of my sweet corn planted last summer grew only a foot high and had no ears on it. We found that there were white worms about the size of a thread at the roots and I was advised to use carbon bisulphide sprinkled on the ground and harrowed in. If you could suggest something that would be cheaper I would like to try it. Would sulphur do any good?—Subscriber, Ventura.

We fear the sulphur would be of little value in control of this pest and, as the subscriber has found out, the carbon bisulphide is altogether too expensive. When that is used it is best to sprinkle in a furrow and cover as soon as possible. When sprinkled on the surface it is too far from the soil occupied by the pests. About the only method of escaping from this pest is to eradicate by moving the crops to unfested soil and allowing the infested soil to go fallow or to be planted to such crops as are not attacked by the wireworm. Above all, keep down weeds or natural growth on the soil and the pest may be in time starved out.

Orange Thrips

What has made my orange leaves look like this? They were sprayed in summer with lime-sulphur. Would that cause the trouble? In some of those curled leaves is a spider nest and a little light gray spider. Is that what is called the "red spider"? With what should I spray, and what strength? Should I spray now or later? Two of leaves sent are new ones, which also look eaten, but very few of the young leaves are affected.—Subscriber, Lincoln.

These leaves indicate serious attack of citrus thrips. The leaves which had been eaten were probably attacked by rose chafer. This, however, is trouble of little concern in the present case. Another season spray with lime-sulphur one part of commercial solution to 80 parts of water. This wash will cause a slight burning. Spray just after the petals have fallen from the flowers, a second time ten or 15 days after the first, and a third four weeks after the second. Then another application may be made either in August or September.

Walnut Codling Moth

Can a few apple trees infested with codling moth infest nearby walnuts? I am told the walnut moth is the same pest.—Subscriber, Oxnard.

It is generally believed that the apple codling moth is identical with the one infesting walnuts. Therefore, there should be greatest care in reducing the pest either on the apples or the walnuts. The method of control is usually by means of a liquid spray on apples three or four times during the season, beginning with blossoming. The arsenate spray is used. For walnuts, the tree being so much larger, the dry or dust spray is generally used.

Flowering Shrubs

Please advise me of at least 12 varieties of flowering shrubs that would be suitable to grow in the San Joaquin Valley. Our summers are long and hot and there is some alkali in the ground, although we have plenty of water to take care of any plant that would be suitable here.—Subscriber, Kerman.

Abelia rupestris, or *grandiflora*; *Arbutus unedo*; *Berberis Darwinii*; *Bottle Brush*, any species; *Carpenteria Californica*; *Caryopteris mastacanthus*; *Ceanothus*, any species; *Coronilla glauca*; *Cotoneaster pannosa*, or any species; *Crataegus pyracantha*; *Escallonia*, any species, but white best; *Genista fragrans*; *Myrtus communis*; *Nerium Oleander*, any color; *Polygala Dalma'siana*; *Spartium junceum* (*Genista Hispanica*); *Viburnum Finus* (*Laurestine*). Also the following deciduous shrubs: *Deutzia*, any species; *Forsythia suspensa*; *Lagerstroemia Indica* (*Creepe Myrtle*); *Philadelphus*, either species; *syringa* (*Lilac*), any color; *Tamarix*, any species; *Weigelia*, any species.

Apples on Pears

I have been intending to topwork a few pear trees to apples. My pears are Bartlett and I intended to graft over only three or four for family use. Since seeing a statement that pears cannot be successfully grafted on apples in a recent Cultivator I have been wondering whether it would be scribe of the Cultivator has tried and best to do so.—Subscriber, Cupertino.

Top grafting of pears to apples is not a success. If, however, any subscriber

Cultivator's Monthly Prize in State Dairy Cow Competition

THE taxpayers of Los Angeles County, especially those who are farmers, have for some time taken much pride in the fact that the county farm is a real farm. Its dairy especially has been a profit maker for the county. The individuals in the dairy are largely grades, though the proportion of pure breeds has been increasing almost every day. Some years ago since the farmer left the institution has been entirely under direction of Superintendent Harriman. Mr. Harriman made a study of his foundation stock and proceeded to better it. He has the ability to choose real producing stuff.

It is with much gratification that we give the following communication from Prof. F. W. Woll regarding the Cultivator's monthly prize which goes to Mr. Harriman for the Los Angeles County farm. An average of over 75 pounds from each of the five best cows is certainly a remarkable record. Especially wonderful is the record made by Princess, almost 100 pounds for the month.

By F. W. Woll

The monthly prize offered in the state dairy cow competition by the California Cultivator for the highest average production for five grade cows in a herd headed by a pure bred sire was won for the month of November by the Los Angeles County farm. The yields of their highest producing grades were as follows:

Grades in other herds competing for this prize produced on an average as follows during the past month: Earl Graham, Compton, 65.39 pounds butterfat; credit 73.29 pounds. F. F. Pellissier, Whittier, 61.88 pounds butterfat; credit 61.88 pounds; C. E. Fisher, Hughson, 44.95 pounds butterfat; credit 50.73 pounds. Albert Burger, El Centro, 50.33 pounds butterfat; credit 50.33 pounds.

An average production of 69.81 pounds of butterfat corresponds to about 81½ pounds of commercial butter, which is far better than most pure bred cows will produce in a month and is over three times as much as an average good dairy cow will yield. The dairy cow competition has shown so far that there are grades of such productive capacity in three different herds in the state and that others rank close to them. As the competition progresses and new cows are entered, other herds will come to the front and secure for their owners a reputation for having exceptionally good cows and knowing how to feed and handle them to get most creditable returns.

Entries in the competition will be open until April 1, next year, and cows calving prior to that time may be entered, as they freshen, and compete for prizes. Information concerning the competition, as to prizes offered, rules, etc., may be had by addressing Prof. F. W. Woll, University of California, Berkeley.

	Age Yr.	Days in Milk	Milk Lbs.	Butterfat Lbs. %	Total Credit* Lbs.

Feeding the Cow---For Boys

A writer in Wallace's Farmer of Des Moines, Iowa, on the page devoted to "Farmers of Tomorrow" has some suggestions for boy farmers which may be of value to California farmers. Timothy hay, corn stover and a few other feeds there suggested may not be available, sorghum or other roughage are, and the suggestions may stimulate a bit of thought as to wherein California excels in opportunity. We hope for California boys and girls the same as the Iowa writer hopes in the first sentence below.

Feeding the Cow

I hope that you have to feed and milk at least one cow every night and morning. Of course it gets very monotonous and there are times when you would give almost anything to get away from the everlasting chores.

I want you to get to thinking how you can get the most milk possible out of your cow. Suppose you see if you can't feed your cow in such a way that she will give three or four pounds more of milk every day than she usually does. Now in feeding the cow the first thing to think about is the kind of rough feed. The common kinds of rough feed are clover hay, alfalfa hay, silage, mixed hay, timothy hay, corn stover, sorghum, Sudan grass, millet and oat straw. Which do you have? The best combination of all is corn silage with either clover hay or alfalfa hay. If you have that combination you can feed your cow an average of 30 to 40 pounds of silage every day, together with ten or 12 pounds of clover or alfalfa and a few pounds of some such grain mixture as two parts oats, two parts corn and one part oil meal. With this kind of a roughage ration and with Holstein or Shorthorn cows, you can feed about one pound of the grain mixture to each four or five pounds of milk and get good, cheap results.

The poorest rough feeds are timothy, straw, corn stover, millet hay, sorghum hay and Sudan grass hay.

If you feed this kind of roughage you have to feed far more grain for the same amount of milk than most people do. With a silage and clover hay ration you can get 20 pounds of milk out of an ordinarily good cow by feeding two pounds of corn, two pounds of oats, and one pound of oil meal every day, but when you feed your cow 20 pounds of such rough feed as timothy, oat straw, corn stover, etc., you have to feed in addition about three pounds of oats, one pound of corn, two pounds of bran and two pounds of oil meal in order to get 20 pounds of milk.

A mixture of such roughages as timothy hay, corn stover, oat straw, etc., with such roughages as clover and alfalfa hay, works very nicely. Ten or 15 pounds of timothy hay or corn stover in connection with ten or 15 pounds of clover hay or alfalfa is almost but not quite as good as a mixture of 30 pounds of silage and ten pounds of clover or alfalfa hay. When you use this kind of a roughage you can get along very nicely with a grain mixture of two parts of corn, two parts of oats and one part of oil meal.

It is a general rule to feed about one pound of grain to each three pounds of milk which the cow produces. But in the case of a Holstein or Shorthorn which has recently freshened, one pound of grain to each four or five pounds of milk is plenty, whereas in the case of the Jersey or Guernsey which has been milking for five or six months it may be a good plan to feed one pound of grain for each two pounds of milk. In the case of a cow which has plenty of good quality silage and alfalfa or clover hay, you may get along very nicely by feeding only one pound of grain to each five or six pounds of milk, whereas in the case of a cow which gets such poor roughage as timothy or corn stalks, it may be necessary to feed one pound of grain to each two and one half pounds of milk in order to keep the cow from falling down very rapidly in her milk flow.

60 REGISTERED 60 GUERNSEYS

AT PUBLIC DISPERSAL

Revada Ranch, Yountville, Cal.

Thursday, January 20, 1921

This is an absolute dispersal of the well known Revada Herd of registered Guernseys, founded by B. E. Nixon, and now owned by Mission Land & Cattle Co., who will devote the ranch to other purposes.

IMPORTED FEMALES—The herd contains a number of imported females, including daughters of such famous sires as Governor of the Chene, Raymond of the Preel XIII, Robert's Secret, and others of corresponding merit.

THE HEIFERS—Bred and open heifers, and heifer calves comprise a large percentage of the offering. Many of these are out of imported dams, and by such sires as Auricle's Cherub of Edgemoor, Imp. Ricardo of Edgemoor, Itchen Daisy May King of Langwater, and other sires of most desirable breeding.

THE BULLS—The offering of bulls marks a most important event in the affairs of the Guernsey breed in California, for never before have so many bulls of the breed been offered at public auction in the state. The sale list includes a number ready for service, others nearly ready, and some very choice bull calves. Included in the list are several sons of Itchen Daisy May King of Langwater, brought to Revada Ranch at the then world's record price of \$8000.00. There are bulls in the list that should offer desirable selection to both breeders and dairymen.

Every animal positively guaranteed to be a breeder; every animal over six months old Tuberculin tested and sold subject to retest except as announced in sale ring.

Veterinary

Bloody Milk

I have a cow which gives bloody milk out of one teat. Could you tell me the cause or cure for this? She is young and apparently healthy in every way and as she is a good butter cow I would like to keep her.—Subscriber, Pleasanton.

In regard to our trouble with the cow which is giving bloody milk, will say that this is often caused just after freshening by the rupture of a small blood vessel in the udder in the vicinity of the cells that secrete the milk. Sometimes accidents in which the udder is bruised or injured in some way will also cause this difficulty to occur. Occasionally this difficulty is traced to the result of some disease or infection localized in the udder, but this is quite rare. Bathing the udder with hot water will often improve this condition, and frequent milkings are desirable in order that the udder may not become distended and the blood vessels will therefore get an opportunity to heal of their own accord. If this condition does not clear up after reasonable treatment it would be desirable to consult a veterinarian.—G. E. G.

Dehorning Wound

Early in October I purchased a Guernsey cow that had been dehorned in the latter part of September. The one horn healed up splendidly but the other, even with the greatest care in washing and disinfecting, will not heal. The horns I think were clipped and as the cow is six years old I am wondering if it is possible that the horn was too hard for the clipping process and thus is cracked. Would such a case cause festering for so long a time and what treatment is best to effect a cure?—Subscriber, San Fernando.

The clipping of horns after the animal is as old as your cow often causes a cracking of the horn below the point of clipping. Trouble is often caused by an injury of this kind and especially by not getting good disinfectant material sufficiently into the wound. I would suggest that you wash the wound out thoroughly, using a small hand pump or syringe if possible, to get the disinfectant material well down into the wound. All the pus should be washed out. A disinfectant suitable for this is lysol, about a 3 or 4 per cent solution. Various creosol dips may be used, but lysol is preferable. This disinfectant should be used every day for at least a week or ten days until the wound shows signs of healing when it is not necessary to wash it every day. It will then be desirable to paint the wound thoroughly with good pine tar which will prevent flies from bothering the wound and has a healing effect. If you are not able to note an improvement within two weeks, it would be advisable to consult a veterinarian.—G. E. G.

FEEDING THE CALF

The calf should have its mother's milk for a while, as its digestion requires it. After a few weeks skimmed milk may be fed, but it is wise to begin gradually with skimmed milk. Whole milk may be fed from the pail if the feeder prefers to feed the calf from the beginning.

As soon as the calf begins to nibble hay it should have concentrates and grazing. But the fact should be remembered that a calf's stomach is not suited to much bulky feeds and for that reason should have concentrates. Bran, shorts, rice polish, linseed meal and cottonseed meal may be fed as soon as the calf gets old enough to eat. When it eats heartily and can thrive on feeds, milk diet may be left off.—Farm and Ranch.

The Range Stock Growers Association met in Salt Lake City, December 11, and adjourned to hold another meeting at El Paso just prior to the meeting of the American Livestock Convention at that place. "Better cattle, and fewer," was the theme of the conventions.

CALEDONIA SHORTHORNS

Imp. Caledonia

Caledonia Shorthorns constitute one of the choicest collections of the breed owned in America. Our herd bulls, Imp. Caledonia, Gainford Matchless, grand champion at the 1919 San Francisco show and Pine Grove King stand out prominently in the West. Our females represent choice Scotch and American families, and are noted for their type and quality. We can at all times furnish foundation material and bulls suitable for any herd or for the range. Our prices are moderate and every animal is guaranteed. Visit our farm and herd. Send for special bull list.

The Victory Herd of Holsteins

Holsteins of known value, headed by Sir Piebe De Kol Segis Pontiac, a son of King Segis Pontiac Count, acknowledged one of the breed's greatest sires, and our junior herd sire, King Pontiac Alcartra Prilly, whose dam made 36.61 lbs. butter out of 895 lbs. milk in 7 days, now on yearly test. A young bull from this herd is a profitable investment.

Col. W. C. Lookingbill Expert Livestock Auctioneer

Has the reputation of being the most successful auctioneer on the Coast, by those who see his work "ON THE BLOCK." Is one of the best posted auctioneers as to Pedigrees and Values of any Auctioneer in the United States. Twenty years of successful breeding, buying and selling, for many of the leading breeders of the Middle West has put me in a position to be of much value to you, if you are planning to hold a Public Auction the coming season. A REAL AUCTIONEER. Try me, and if you are not satisfied that I have NO SUPERIOR on the Coast, it will not cost you a penny. Address, or wire me, 539 E. Pasadena St., Pomona, California. P. S.—Will go any where in the United States or Canada.

COL. W. C. LOOKINGBILL
Prop. of Union Stock & Sales Yards, Pomona

Shire Horses FOR SIZE BONE and QUALITY

More is required of horses than ever before hence the need of more size, weight and power. Large geldings never were higher. Shire geldings usually top the market. Use Shires to raise larger and better horses.

For information on Shires write, W. G. Lynch, Secretary American Shire Horse Association, Toplea, Illinois

When writing advertisers, mention the Cultivator.

Wheat: Mixed feed, 33.00.
Barley: 1.55.

HAY

Alfalfa Growers of California, report under date of December 22:
Receipts and offerings of alfalfa hay which diminished sharply last week, were again rather light this week, while the demand for current consumption continues at the previous rate. The present general business atmosphere is such that dealers and users do not buy more at a time than is absolutely necessary to fill their immediate needs, but since in the case of alfalfa the stocks previously accumulated are on the average already down to a near minimum, compared with other years, it would seem that this general demand, though only of the "from hand to mouth" order, is bound to continue steadily. Your sales management believes that it is in the best interest of all concerned to have us meet this demand adequately, thus heading off erratic market fluctuations and assuring the uninterrupted and steady continuation of business. We would therefore ask our growers who still have a marketing surplus, to list same a little more freely, to enable us to regulate the general distribution over the balance of the crop year in accordance with the current demand as far as this is possible.
There were 370 tons received on the tracks in Los Angeles the week ending

December 18, with 630 tons left over as against 375 tons the week before.

PERFORATED TREE PROTECTOR

that will keep Squirrels, Rabbits and Gophers from barking your trees and give perfect protection from hot sun, sandstorms, barking in cultivation, etc. Tell us your pest and we will tell you what kind of a wrap to use. We make a number of kinds and can save every tree for you from pests.

COLLAPSIBLE PLANTING POTS

Why not raise your early

Tomatoes, cabbage, chili, and egg plant for home use or for market. Do you know that you can start Cucumbers, Cantaloupes, Melons of all kinds in these pots in flats until they have three and four leaves, then plant pot and all, have melons two or three weeks earlier for market. Just the thing for Propagating Eucalyptus and Olive cuttings.
Write for samples and prices of both Pots and Protectors. State which you are interested in.

THE EXPAN CO., 935 E. CENTRAL AVE., REDLANDS, CALIF.

THE "Sentinel" Recording Gauge Provides "The Better Way,"

brings the handling and distribution of irrigation water up to par with the modern methods of ranch management and business practice. It fills the need long felt among progressive water users and producers for a means to avoid the guess work and waste incident to the open weir system of measurement, without heavy initial outlay or maintenance costs.

"Sentinel" Irrigation Meters afford the most direct and efficient means for the measurement of irrigating heads of water through steel or concrete pipes.

Stover Pump Jacks, Long stroke, substantially built, low priced. All sizes, ready for quick delivery.

Special information furnished on all of the above. Address:

HAY

Alfalfa Growers of California under date of December 22: There were 871 tons received in San Francisco the week ending December 18, as against 1,380 tons the week before. No. 1 dairy.....25.00 Standard alfalfa.....23.00 Stock alfalfa.....20.00

Under date of Dec. 18 A. W. Scott Co.: says:

Receipts past week 871 tons. In spite of lighter receipts the market has dragged and prices have gone off another dollar or more per ton. Hay occupies a different position in that instead of being proportionately lower than produce, it is now higher and stronger in proportion than any of the field crops. How soon the general slump might affect the hay market seriously is of course only a matter of guess. Whether the producers will hold back enough of their hay to sustain the price and merely supply the demand without overcrowding remains to be seen, but the present requirements are extremely light and will continue so until business generally is back on its feet. Alfalfa is weaker, heavy consignments coming in from Nevada at lower figures than our California farmers care to accept. Mill feeds and high protein feeds continue weak with perhaps the best demand for coconut and alfalfa meal.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charge of cartage, commission and handling expenses must be added according to conditions).

Wheat hay, fancy.....25.00@26.00 Wheat hay, light 5 wire bales.21.00@24.00

Tame Oat hay, fair to choice..20.00@23.00 Wild Oat hay.....15.00@17.00 Barley hay.....15.00@17.00 Alfalfa hay.....20.00@23.00

Citrus Markets

Los Angeles, December 22, 1920. The holiday demand has been good but prices have ranged low. Condition and quality has been exceptionally good but the general downward trend has put them on the toboggan. F. o. b. California price has dropped to \$2.50 which is far under (Continued on Page 847.)

Central Building, Los Angeles

Guernsey Females

Our herd reduction sale still continues and there is a lot of fine Imported and A. R. cows with high production records and show ring honors left to be sold. We are also offering the choicest lot of young stock ever in one herd in the West. A number of bulls of all ages from the above sired by King of Hollow-Hill and Effie's King.

Also 30 head of females 15/16 Guernsey that will make wonderful family cows.

All T. B. tested and guaranteed breeders.

Everything Priced Reasonably.

Hollow-Hill Farm

Colton, California

Poultry Queries

Conducted by J. A. Koethen

Moldy Grain

In one of the recent issues of the Cultivator I noticed an article about heated corn which caused me to inspect my stack of sacked Gyp corn purchased four weeks ago. To my surprise I found that where one sack touched another the center part was hot. Today I opened a sack and found in the center some lumps of moldy corn which I washed and put on trays and dried. Will it be safe to feed this washed corn to the chickens? If I cannot it will cause me considerable loss.—Subscriber, Oroville.

When mold has once begun to grow on grain it is hardly possible to wash it all off though you may remove all that shows. Mold, you know, is a kind of bacteria, like yeast, and it spreads rapidly, though not at first visibly, through whatever it is on. That is why it is so dangerous to chickens. You might feed this corn without any had results, for hens differ greatly in their susceptibility to mold. On the other hand, it might kill them. It is never safe to feed heated or moldy grain, but you might be able to get away with it if you fed it only to old hens, which are generally less susceptible than young ones.

Roup and Chickenpox

Our chickens have had chickenpox, and now, as they are nearly over it, several have choked to death with a cheesy looking substance in the throat.

We have been feeding sulphur in the mash and putting potassium permanganate in the drinking water. Is there any cure for this trouble?—Subscriber, El Cajon.

Your hens are suffering from a roup condition which sometimes accompanies chickenpox. In this case it is diphtheritic roup, which is hardest of all to relieve, but you may save some of them by swabbing the throat with silver nitrate or hydrochloric acid. If you use silver nitrate I think you will be compelled to use the five per cent solution, but you can ask your druggist about that. Make a swab by winding absorbent cotton on a very small stick, dip in the silver nitrate and touch the whitish places once a day. You can use peroxide of hydrogen in the same way, but more frequently. If you use hydrochloric acid it should be a 50 per cent solution. The object of the swabbing is to burn out the diseased tissues. Another treatment, which is recommended by Dr. Salmon, consists in spraying twice a day with a small syringe containing the following mixture: Extract of witch hazel, 4 tablespoons; liquid carbolic acid, 3 drops; water, 2 tablespoons. Keep the hens in a dry, sunny place and make sure that sanitary conditions are just what they should be.

Swellhead in Turkeys

A number of our early turkeys have what we call swellhead and we have found no satisfactory remedy. Does this come from a germ or do the birds take it without infection, and what can be done for them?—W. B. F., Lemoore.

Swellhead is not an infectious disease. It may be caused by lack of

fresh air, as in the case of turkeys that roost indoors instead of in trees, where they should roost, and it may develop in birds that roost out just because of a roup tendency in the stock. I had such a case once in a bird that had always roosted in the open, and I cured it by the permanganate treatment. Potassium permanganate is a splendid remedy when it is used externally but of no earthly use in the drinking water, as so many people use it. For swellhead drop a few permanganate crystals in a lard pail or quart measure of slightly warm water—just enough to make the solution a deep pink. Dip the head of the bird in this, after first massaging the nostril below the eyes, and hold it there while you count 20. You can let the bird take a breath, then dip a second time if you wish. The object is to wash out the nasal passages so that nature can heal them. Do this morning and night, always preparing the solution fresh, for it loses its strength quickly.

Liver Trouble

We have lost several hens lately and do not know what is the matter with them. They seem to droop and get weaker till they die. Examination shows in some cases a very much enlarged liver and in others straws in the crop, although they are not crop bound. They have fresh baled alfalfa to scratch in, scratch feed at 4:00 p. m., all they want, laying mash before them all the time, chopped fresh alfalfa daily or a run on green range. For a month we fed sprouted grain. It molded often but we took out the worst and washed the rest when it seemed necessary. None of the post mortems showed signs of

aspergillosis. I enclose sample of matted feathers we occasionally find under the wings of birds. Can you tell me what ails them?—Mrs. C. P. C., Fillmore.

The enlarged liver explains the death of the hens in which it was found. As to the others, the data given are not sufficient. That moldy grain might easily have caused aspergillosis, but in that case you would probably have found either yellowish or whitish nodules in the bronchi, lungs and other internal organs or membranous patches of yellowish or greenish color. "In very acute and rapid cases," says Dr. Salmon, "the lungs may simply show inflammation, or there may be formation of pus or abscesses in the kidney, lungs, liver or spleen. In some of these cases there may be extensive hemorrhages, either locally or throughout the body, and these may constitute the only apparent alteration. In the early stages of the disease no symptoms are noticed and it is only after they have progressed considerably that they become apparent. The affected birds do not follow the flock; they are very weak, scarcely able to stand, and consequently remain by themselves and move about very little. They remain in a recumbent position, resting upon the sternum, are sleepy, and if forced to run soon fall from exhaustion. The plumage is dull and rough, wings pendant, eyes partly closed, head depressed. The respiration is accelerated and accompanied by a rattling or snoring sound, particularly during expiration, and becomes difficult and labored, the bird opening its beak from time to time, in order to take a long inspiration."

I have quoted this description, not because I think your birds had aspergillosis, but because there has been a good deal of it this fall, and everyone ought to know the symptoms. It seems quite likely to me, though you do not give the symptoms, that all the hens that died had liver trouble and that the cause is probably overfeeding of grain or possibly too concentrated a ration. You had better make the mash half bran and cut down on the grain. At this season of the year pullets should have more grain than mash, but old hens should have about equal amounts. If you are feeding a good deal of corn or milo, Gyp or Kafir cut out part of it and feed wheat instead, and be sure the hens have green feed before them nearly all the time.

I think it is nits of lice that are matting the feathers together.

Bronchitis

Some of our chickens have a rattling in their throats and a discharge from their nostrils. They eat well and are otherwise all right. We have given them bluestone and potassium permanganate in the drinking water and put kerosene in their nostrils. What remedy can you prescribe?—Subscriber, Fallbrook.

Outside of removing the cause, which is the first and best remedy for any disease, I have found nothing that helped bronchitis so much as olive oil. Pour it down their throats two or three times a day, a tablespoon at a time (if you can get that much down) from a small pitcher or bottle. You can spray their nostrils if you like, with this spray, which Dr. Salmon recommends for more severe cases: Extract of witch hazel, 4 tablespoons; liquid carbolic acid, 3 drops; water, 2 tablespoons. Potassium permanganate in the drinking water (pink tea) is practically worthless, because it loses its strength so soon in solution, and kerosene is pretty severe. Bronchitis is caused almost invariably by dampness somewhere. It may be you have too many hens in a house, or that the house is badly ventilated so that moisture collects on the walls at night. Possibly your yards are not well drained or your houses do not face the sun or stand in a hollow so that the damp air falls on them instead of away from them. Whatever the cause is, you will have to remove it before you can cure the trouble permanently.

Give generously of yourself this Christmas. Unless some of your love, your thoughts and your interest in others accompanies your gifts they will be of small value no matter how much they cost.

OLYMPIC POULTRY FEEDS

Make a Healthy, Productive Flock

POULTRY feeds must contain the proper ingredients, correctly blended and accurately balanced, to produce maximum results. That is why every comparative test proves OLYMPIC Poultry Feeds to be without either equal or superior.

THE PORTLAND FLOURING MILLS CO.,

Sebastopol, Cal., Sept. 22, 1920

Gentlemen:

I have checked up my egg record for the first three weeks of September, during which time I used your OLYMPIC SCRATCH FEED and OLYMPIC EGG MASH, and I find my flock showed a remarkable increase, the average of the last three days of the test over the first three showing 137 1/3 eggs per day increase, or 70% gain. My hens are also laying the largest eggs I have ever had, weighing over 26 ounces to the dozen. The pullet eggs went to 19 and 22 ounces on the OLYMPIC feeds. This I call remarkable.

I have been breeding for forty-five years and exhibiting for thirty-five years.

I am delighted with your special molt and spring laying mash.

Enclosed find my full egg record for the twenty days, September 1st to 20th.

Yours very truly,

WM. BACON.

Dried Buttermilk

The drying of buttermilk for the various OLYMPIC Feeds, is proven the only practical method of introducing this most valuable ingredient into prepared feed. It does not become rancid when shipped or stored, nor lose any of its desirable qualities. The water has simply been removed, leaving the buttermilk in highly concentrated form.

OLYMPIC Scratch Feeds

BABY CHICK SCRATCH consists of small, uniformly ground grains suited for the critical first three weeks' feeding.

GROWING CHICK SCRATCH—Of slightly larger grains for the youngsters up to 8 or 9 weeks of age.

SCRATCH FEED—For full grown chickens. Properly balanced proportions of Wheat, Cracked Corn, Kafir Corn, Milo Maize, Hulled Barley, and Oats, Buckwheat and Sunflower Seed.

CRATE FATTENER tears down the muscles and builds up the flesh; making the meat whiter, sweeter and more tender in the shortest possible time.

If your Dealer cannot supply you, address

The Portland Flouring Mills Co.

Merchants Exchange Building.

San Francisco, California

C. B. Sharp, Agent.

OLYMPIC Dried Buttermilk Feeds

DRIED BUTTERMILK in the following feeds not only supplies its share of nutrition, but the lactic acid multiplies the digestive and assimilative properties of all other ingredients contained therein.

CHICK MASH is a body builder and feather grower. It climinates the dangers of White Diarrhoea or bowel trouble.

EGG MASH is the egg-making feed and tonic for health and strength. It increases laying to a greater extent, over a longer period and with 20 per cent less feed consumed.

JOHNSTON TURBINE CENTRIFUGAL PUMPS

Installations can be made in wells 10 inch or larger. Produce 200 to 4,000 gallons per minute. Ask for Folder No 4. American Well & Prospecting Co., 407 E. 3rd St., Los Angeles.

Save Money—Buy Pipe From Us

Farmers, Miners, Builders—people in every kind of business are saving money buying used or renewed pipe from us. We sell every kind of pipe. Send in a list of your requirements today and get our prices. We have saved hundreds of people 33 1-3 to 50 per cent on their pipe bills. Here's a partial list of some of the miles of pipe we have in stock for immediate delivery:

8,000 ft. 6 inch Riveted 16 Gauge
700 ft. 8 inch Riveted 16 Gauge
5,000 ft. 12 inch Riveted 12 Gauge
1,000 ft. 18 inch Riveted 12 Gauge
800 ft. 22 inch Riveted 14 Gauge
300 ft. 24 inch Riveted 14 Gauge
500 ft. 36 inch Riveted 12 Gauge
10,000 ft. light wrought iron 8 inch pipe with cast iron collars.

All above pipe thoroughly overhauled and inspected and ready for immediate use.

We also have large quantity standard pipe and screw casing, pressure tested and guaranteed.

Don't delay—write for our prices on your pipe requirements today.

GERMOZONE

"the Best Remedy for Poultry and Pet Stock"

The old reliable, proven remedy for Roup, Colds, Canker, Swelled Head, Bowel Trouble, Snuffles, Wounds, Sores, Loss of Fur or Feathers, Skin Disease, Etc.

H. A. Klewert, 5042 N. Long Ave., Chicago, Ill., says: "I had some of the worst kind of cases of roup in my chickens and I thought I would not save any but I have saved these birds, thanks to Germozone." H. A. Haines, Rosalia, Kas.: "If we had tried Germozone at first it would have saved us \$1,000 worth of expensive experiments." Mrs. T. A. Morley, Gallen, Mich.: "Have used Germozone 17 years and could not get along without it." E. W. Thiel, Waukesha, Wis.: "I have used your Germozone for white diarrhoea in baby chicks and sure got wonderful results. I also use it right along on grown fowls."

Germozone is sold by most drug, seed and poultry supply dealers, or mailed postpaid in 25c, 75c and \$1.50 packages, from Omaha. Poultry Book and Book on Diseases FREE.

QUESTIONS AND ANSWERS

(Continued from Page 839.)

succeeded we will be glad to pass on the information.

Copyrighting Farm Name

Can a ranch name be copyrighted? If so, what would be the advantage and how would one proceed? Could I obtain a list of ranch names already copyrighted?—Subscriber, Anaheim.

There are some two or three methods of protecting a ranch name or a trade mark. We believe that by writing to the Secretary of State for California, Sacramento, and asking for blank application one will receive the blank which will permit the application in regular form. This with a fee of \$5 gives protection within the boundaries of the state. Where one wishes protection for a trademark or brand to use in marketing any product in any state of the Union he may secure it by writing Patent Office, Washington, D. C., and applications will be forwarded and a copyright or trade mark right secured. Where Eastern markets are to be sought for a particular product the federal trade mark rights should be secured. We believe there is also a farm name protection, which may be secured through the secretary of state, which would give exclusive right to the use of the name as applied to a farm. We presume the secretary of state can also give list of such names as are already protected. There is little of value other than sentimental excepting where one wishes to protect the mark on any product to be put on the market.

Gumming of Prune Tree

I want some information in reference to my prune tree which I planted two years ago. It has not made sufficient growth, although it bore some fruit this year. Early in the summer it started to shed gum from the joints in the stocks, now it has reached to the tips of the branches. Is this a disease? If so, how can I treat it, or had I better replace it with another? If I have to replace what would the best kind be for this district?—Subscriber, Los Angeles.

This matter of gum on deciduous trees is most exasperating as it is an indication of trouble rather than a disease in itself. It is in no sense like the gum disease or gummosis of citrus trees. Hesler's "Manual of Fruit Diseases" says: "Like other stone fruits, the plum is subject to gum flow when injured in any way." "Gum flow is here used broadly to indicate a sign of disease or injury rather than any specific disease." However, it adds: "In the Pacific Northwest a bacterial gummosis has recently been studied, and the cause, found to be Bacterium Cerasi." "This trouble on the plum is often erroneously called winter injury and sun scald, but it has been shown that in most cases at least the action of the sun has nothing to do with the production of this disease. Cankers similar to those on the cherry are produced. Such lesions on the plum, however, exude noticeably less gum than those on the cherry." The Oregon agricultural experiment station, Corvallis, issued a bulletin by U. P. Hendrick on gumming of prune trees in that state. We believe there is no cure other than to create right conditions of soil and moisture to put the trees in good health.

Walnut Codling Moth

Owing to the great size of walnut trees the "spray" generally used is that known as the dry or dust spray. The spray consists of kaolin, merely as a carrier, with nicotine sulphate and arsenate of lead added. Proportions may be somewhat changed by conditions, but here is the formula as given in the Cultivator's spray number, August 9, 1919: Nicotine-Arsenate. Kaolin (about) 67 parts, hydrated lime (about) 16 or 17 parts; nicotine sulphate (40 per cent) 1 or 2 parts, dry arsenate of lead 15 parts. However, this dust spray is now being offered to trade ready prepared for use and doubtless would be more effective than home made mixture. The time for the application is at blossoming time or soon after in the spring. Mean-time secure thorough eradication of pest which may be hidden in old sacks, boxes or in warehouses.

OilPulls are Built to Last

The supreme endeavor of the makers of the Rumely OilPull tractor has always been, and always will be, to build into each machine such perfection that even under the roughest use and abuse of farm work it will establish a record of dependability, economy and long life that can be equalled only by other OilPulls.

That's why there are hundreds of nine, ten and eleven year old OilPulls still on the job.

GRAIN AND COTTON SEED

BUNYIP, BAYAH and DART IMPERIAL SEED WHEATS

California acclimated Australians; best milling; higher prices for product; yield well; shatter loss in wind than other varieties known to us.

MARIOUT

There is large demand for this early maturing, drought resistant barley. Car load just shipped Miller & Lux averaged approximately 180 lbs. per sack. All our re-cleaned Mariout, when well-fitted, has approximately such weight.

All our seeds grown on new soils, one irrigation only. All water from deep wells. No Bernuda, Johnson or Morning Glory.

Last call for Beldi Barley, Sonora, Early Baart, and the so-called Diener Hybrid Wheats, but can yet supply less than car load lots. No Tennessee Winter or Four Thousand Barley.

DURANGO and MEBANE COTTON SEED

Fully matured seed from purest strains known to us, grown in selected hand-rogued fields. We operate our own gin, carefully avoiding seed mixing.

All seed orders, whether car load lots or less, booked as received, shipments following consecutively.

Write for prices, stating quantity desired.

CITRUS MARKET

(Continued from Page 843.)

average for any before Christmas sales. Floridians have been selling in Southeastern states at around \$1.75. Practically none are being shipped from California now and most houses will remain closed until well toward the middle of January.

The lemon market is even more demoralized than it has been for months.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 1,046 cars; lemons, 616; total, 1,662. To same date last season: Oranges, 2,946; lemons, 534; total, 3,480. From Central California to date this season: Oranges, 3,283; lemons, 27; total, 3,310. To same date last season: Oranges, 3,003; lemons, 87; total, 3,090. From Northern California to date this season: Oranges, 271; lemons, 2; total, 273. To same date last season: Oranges, 343; lemons, 15; total, 245.

CHRISTMAS SILLIES

Remember This. It's foolish to be extravagant at Christmas. If you really wish your friends to remember it, give them a cheap present.—Lippincott's.

Suspicious. Nurse: "Here is a little brother for Christmas."
Johnny: "Looks like some one had passed on the one they got last year."
—Judge.

Small Favors. Mrs. Meyser: "Could

you give me a little Christmas money, my dear?"

Mr. Meyser: "Certainly, my dear. About how little?"—Life

Anticipatory. Madge: "Are you going to announce your engagement at once?"

Marjorie: "Gracious, no! Not until after Christmas. I'm afraid it would scare off a lot of presents."—Judge.

POISON GASES AND FARM PESTS IN AUSTRALIA

The utilization of poison gases upon a large scale in the recent war has prompted in the lay mind many speculative suggestions as to its adoption upon a commercial basis as a means of attack upon many of the pests that inflict loss upon our primary industries. Long before the war, however, scientists had given close consideration to the question and fumigation was a firmly established practice for the destruction of various farm and orchard pests. The efficacy of various gases for killing rabbits has also been tested and the conclusion was arrived at that in Australia carbon bisulphide was for all practical purposes the most suitable. Its use, however, was not advocated for general adoption, being applicable only in certain circumstances. In this experimental work the vermin destruction board of Victoria has tested a number of gases and has reached the conclusion that where gas is applicable commercially, carbon bisulphide gives the best results.

WINDBREAK TREES

Director Hecke has received the following interesting letter from John Vallance, an experienced tree man at Oakland. Mr. Vallance says:

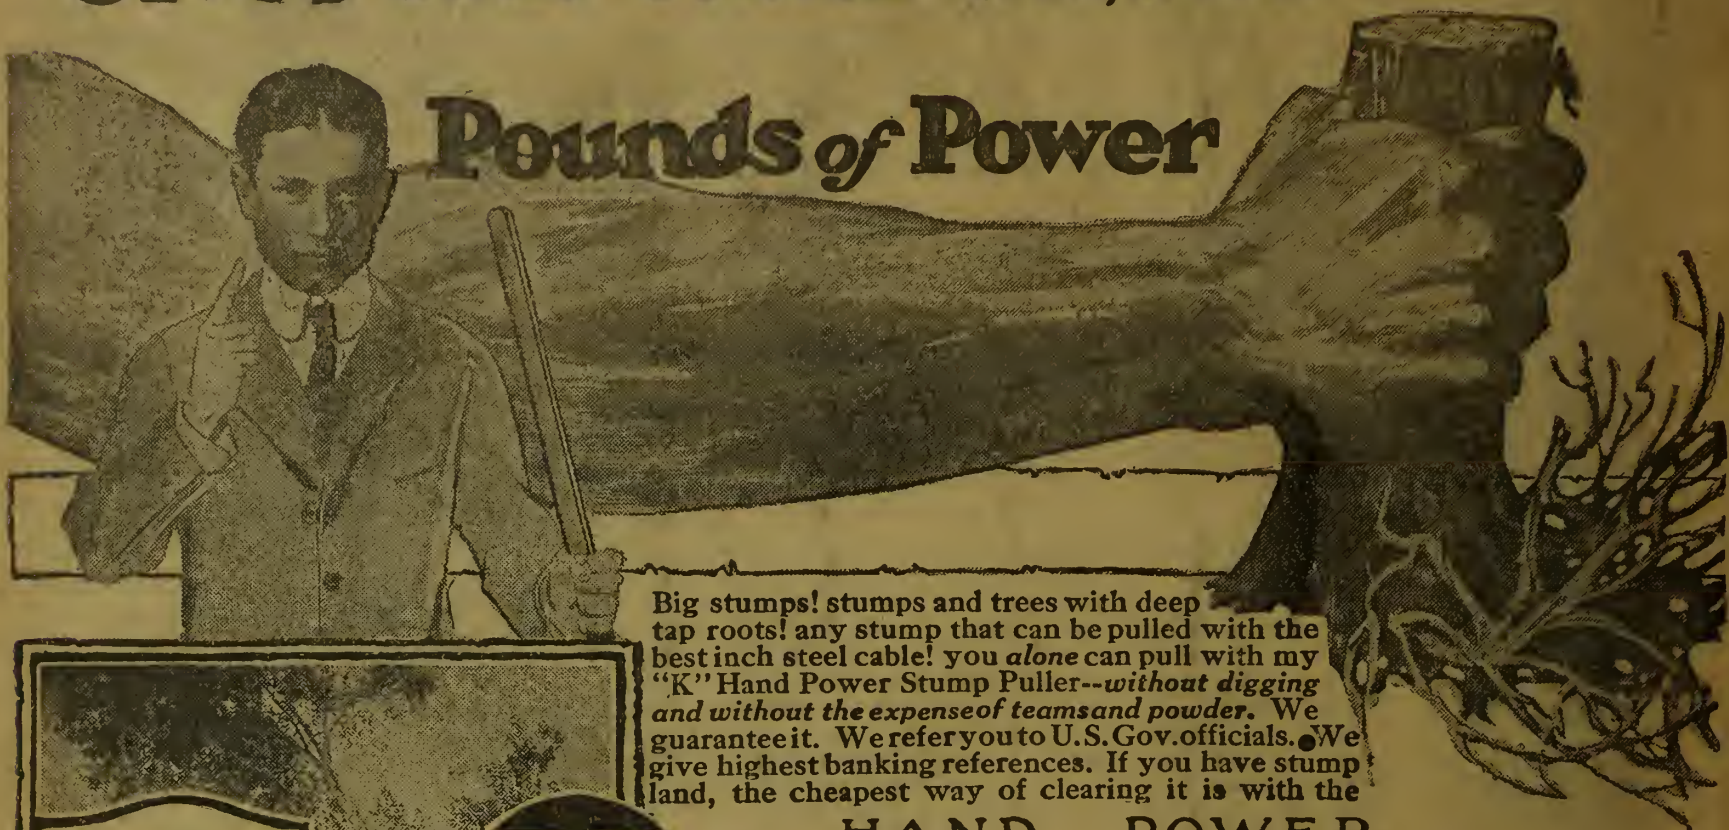

"I am just in receipt of your News Letter of recent date and have read with much interest your remarks upon 'Windbreaks.' For many years I have thought and written a great deal upon this subject, and whenever I could I recommended the Casuarina stricta for this purpose. It is very well adapted for the hot interior valleys as well as for the Coast regions; it is a wonderful tree of very fast growth and can be headed back to any part of the tree, as it is full of live eyes and will break away at any place where it is severed. Not only is it good for windbreaks, but in Australia, of which it is a native, it is wonderful how well cattle and sheep thrive upon its growth. I have never seen this tree affected with any kind of scale or insect pest.

"How many of the farms you notice, when driving along, have no shade for the horses, cows or hogs. There they stand in the hot, broiling sun, eking out a miserable existence, whereas if superior man would but plant a few trees how different their lives would be. Everything is 'protective' nowadays; then let's have protective windbreaks and protective shade for our stock."

Gives Your Hand 96,000

Pounds of Power

Big stumps! stumps and trees with deep tap roots! any stump that can be pulled with the best inch steel cable! you *alone* can pull with my "K" Hand Power Stump Puller--*without digging and without the expense of teams and powder*. We guarantee it. We refer you to U.S. Gov. officials. We give highest banking references. If you have stump land, the cheapest way of clearing it is with the

HAND POWER

K Stump Puller

How the "K" Pulls Biggest Stumps A Mechanical Wonder

The "K" works on the leverage principle. Made of finest steel—guaranteed of the ordinary lifting jack, except that against breakage. Weighs only 171 lbs.—the power is applied on a cog-wheel in-easily carried or hauled about on its own stand of a standard. 100 lbs. push on the truck wheels. Has two speeds—60 feet lever develops a 48-ton pull on the stump—per foot per minute for hauling in cable all an inch steel cable will hold. One or for small stumps—slow speed for man operates it alone—no teams heavy pulls. *Works equally well on hillsides and marshes where horses cannot work.*

Owners Praise It

H. Sinclair of the Dept. of the Interior, a U. S. Gov. official, writes: "The stump puller is a wonder." Ernest Thompson Seton, author and naturalist, declares the "K" "a great success."

Hundreds of owners write in, telling of pulling six- and seven-foot stumps, of pulling faster and pulling bigger stumps than by any other machine.

Special Offer We are making a special offer to get a "K" Stump Puller introduced in every neighborhood. Write us today for full information and for free book on Land Clearing and about our Wonderful Drag Saw.

The Fitzpatrick Products Corp.

Box 17
99 John St., New York
16th and Kansas Sts., San Francisco

Frank Hance, a one-armed farmer of Bowie, Md., pulling double silver maple 3 ft. 8 in. in diameter at the ground, with deep tap roots. This is an easy pull for the "K" as the cable can be hitched high and the leverage is consequently greater.
